# Epifluorescence-based microvasculature network versus retinal imagery (DRIVE)

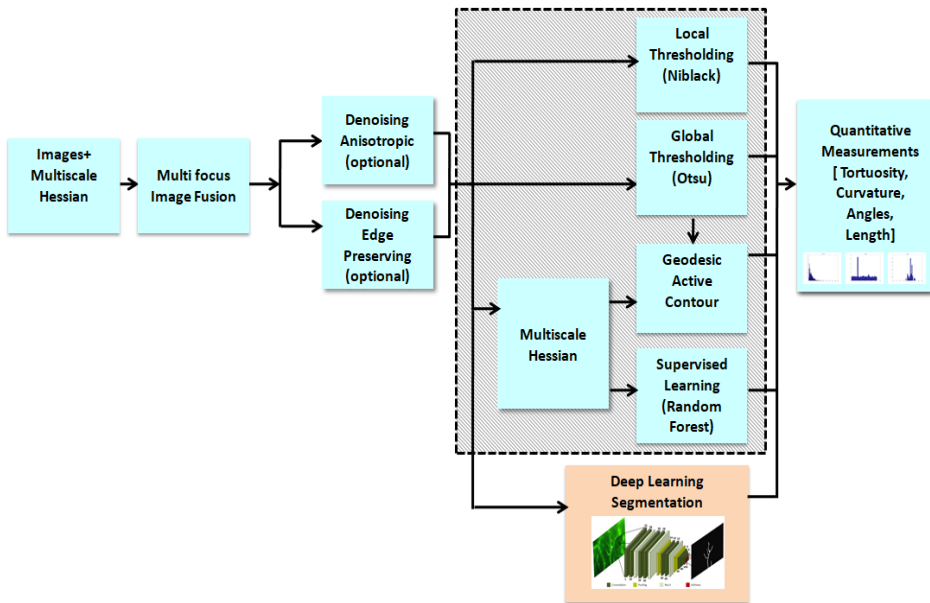

- 1 Graph Network vs Tree Structure
- 2 Greater texture variability in both fg and bg
- 3 Inhomogeneous staining of the microvasculature
- 4 Different binding properties between arterioles and capillaries
- 5 Uneven contrast, low texture content
- 6 Nonlinear binding of the fluorescence dye

# Challenging cases for fluorescence-based microvasculature network segmentation

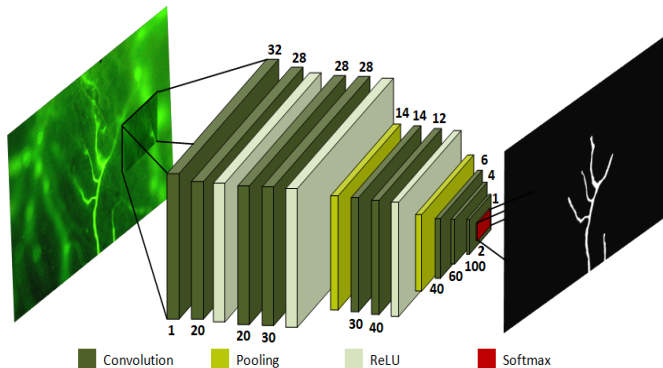

# Microvasculature segmentation and analysis

# Training and Testing

- 1 Our DBNet uses  $32 * 32$  microscopy image patches.
- 2 Output two classes for microvasculature network as foreground, and other regions as background.
- 3 880600 Training patches from 10 different epifluorescence microscopy images with stride equal to 4 .
- 4 Border patches not used: FG vessel if the corresponding ground truth

has all 1's.

- 5 Testing phase uses overlapping patches through the network to obtain smooth binary segmentations.

# Trained patches VS. Dice values

Stride	patches number	Dice value
256	300	17.73
128	990	68.68
64	3740	74.47
32	14190	81.04
16	55250	83.68
8	221000	84.77
4	880600	85.26

- 4 Conclusions and Future work

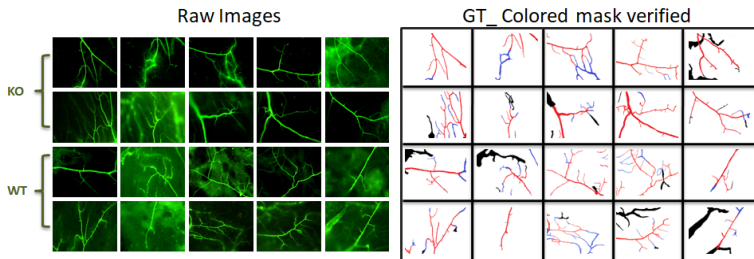

# Ground-truth masks - arterioles, venules, no-care

# Data Set: Epifluorescence Images OVX

- 1 Dataset - 20 images, 10 Wild-type (WT) + 10 Knock-out (KO,  $ER\beta$ )
- 2 Ground-truth (GT) - manually marked by expert Physiologists
- 3 Separate masks for arterioles, venules, no-care

# Quantitative comparison results - Dice values

Legend: Dice (Green), Sensitivity (Red), precision (Blue), Specificity (White), accuracy (Yellow)

Method	Otsu Thresh.	Multiscale Line det.	MNIST (MCT)	DBNet (ours)
Dice	55.91	65.56	80.16	85.26
Sensitivity	67.41	79.48	76.51	79.52
Precision	71.22	59.66	85.24	93.00
Specificity	95.33	97.13	99.54	99.79
Accuracy	94.16	97.80	98.79	99.11

Input

Our Deep Learning Results

# Arteriole results (Otsu, MS\_line, Mnist vs Ours)

MS\_line: Nguyen et al. multi-scale line detection. PR, 2013.

# Outline

- 1 Vessel Segmentation
  - State-of-the-art
  - Motivation and challenges
- 2 Deep Learning Segmentation
  - CNN architecture
  - Training and Testing
- 3 Experimental Results
  - Dataset and ground-truth
  - Comparison results
- 4 Conclusions and Future work

# Conclusions

## Work done:

- ✓ Our deep learning segmentation outperforms other methods in terms of five evaluation metrics.
- ✓ Experimental results for both WT and KO animal models achieves an overall accuracy of 99%
- ✓ General pipeline that can be adapted in biomedical (retinal, neuronal) and curvilinear structures (road network).

## Future work:

- New approach for segmenting the diffused venule regions
- Quantitative analysis of segmented microvasculature structures for statistical evaluation of vessel remodeling between WT and KO
- Apply semantic segmentation

# Appendix: MNIST Configuration in MatConvNet framework applied to our vessels images
