# Background

Existing ultrasound image formation models

- [1,2] 2D convolution between the tissue reflectivity function (TRF) and a fixed system point-spread function (PSF)
- [3] spatially varying kernel convolution
  - spatially varying kernel
  - constant reference kernel modulated by the exponential of a fixed discrete generator
  - overly restrictive
- [4] arbitrary linear model with dense matrix representation
  - reconstruction limited to medium size images

### Pulse-echo emission of focused waves

- the most widely used acquisition scheme in ultrasound imaging.
- sequential transmission of narrow focused beams
- each transmission centered at a lateral position
- laterally invariant kernels
- kernels become wider away from the focal depth
  - dynamic focusing in reception and time gain compensation cannot fully compensate

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- · spatial resolution degradation away from focal depth
- need for an axially-variant kernel model

### Axially-variant kernel ultrasound imaging model

 $\mathbf{y} = \mathbf{H}\mathbf{P}\mathbf{x} + \mathbf{n},$ 

- x tissue reflectivity function (TRF) to be recovered
- y observed radio-frequency (RF) image
- n independent identically distributed (i.i.d.) additive noise
  - we assume white Gaussian but not essential
- Operator  $\mathbf{P} : \mathbb{R}^{m_t \times n_t} \to \mathbb{R}^{m_p \times n_p}$  pads the TRF with a boundary of width  $n_r$  and height  $m_r$ .
  - simple Kronecker structure
  - can be stored in memory as a sparse matrix
- Operator  $\mathbf{H}: \mathbb{R}^{m_p \times n_p} \to \mathbb{R}^{m_t \times n_t}$  performs the axially-variant kernel convolution

### Notation: discrete convolution

Valid convolution  $\mathscr{C}_1(\mathbf{k})\mathbf{a} \stackrel{\text{def}}{=} \mathbf{k} *_1 \mathbf{a}$ Full convolution  $\mathscr{C}_2(\mathbf{k})\mathbf{a} \stackrel{\text{def}}{=} \mathbf{k} *_2 \mathbf{a}$ 

Figure : Convolving test image **a** with a Gaussian kernel **k**. The inner rectangle represents valid convolution whereas the outer marks full convolution; Here, black and white correspond to values of 1 and 0, respectively. Kernel **k** is displayed after min-max normalization.

# Notation: auxiliary operators

Figure : Applying the full-width window operator, followed by a full-width zero-padding operator on a test image a.

Each row  $i_h \in \{1, ..., m_t\}$  of the output image is obtained by the valid convolution between the kernel of that row  $\mathbf{k}(i_h)$  and the corresponding patch in the input image  $\mathscr{W}_p(i_h, i_h + 2m_r)\mathbf{x}$ .

$$\mathbf{H} = \sum_{i_h=1}^{m_t} \mathscr{Z}_t(i_h, i_h) \mathscr{C}_1(\mathbf{k}(i_h)) \mathscr{W}_p(i_h, i_h+2m_r).$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- Many deconvolution models use proximal splitting methods that optimize an objective containing a data fidelity term  $\phi(\mathbf{HPx} \mathbf{y})$ .
- These methods employ at every iteration the gradient of the data fidelity term

$$\nabla(\phi(\mathbf{H}\mathbf{P}\mathbf{x}-\mathbf{y})) = \mathbf{P}^{T}\mathbf{H}^{T}(\nabla\phi)(\mathbf{H}\mathbf{P}\mathbf{x}-\mathbf{y}).$$

• We need computationally efficient expressions of  $\mathbf{P}^{\mathcal{T}}$  and  $\mathbf{H}^{\mathcal{T}}$ 

Fundamental result on discrete convolution

#### Theorem

The adjoint of valid convolution is full convolution with the rotated kernel

$$(\mathscr{C}_1(\mathbf{k}))^T = \mathscr{C}_2(\mathscr{R}(\mathbf{k})).$$

Matrix-free expression for  $\mathbf{H}^{\mathcal{T}}$ 

$$\mathbf{H}^{T} = \sum_{i_{h}=1}^{m_{t}} \mathscr{Z}_{p}(i_{h}, i_{h}+2m_{r}) \mathscr{C}_{2}(\mathscr{R}(\mathbf{k}(i_{h}))) \mathscr{W}_{t}(i_{h}, i_{h}).$$

 $\mathbf{P}^{\mathcal{T}}$  obtained using sparse matrix transposition

### Ultrasound image deconvolution problem

Minimize the additive white Gaussian noise subject to elastic net regularization

$$\min_{\mathbf{x}\in\mathscr{D}_f}\frac{1}{2}\|\mathbf{H}\mathbf{P}\mathbf{x}-\mathbf{y}\|_2^2+\lambda_1\|\mathbf{x}\|_1+\frac{\lambda_2}{2}\|\mathbf{x}\|_2^2.$$
 (1)

Objective F can be split into a quadratic function f and an elastic net regularizer  $\Psi$ 

$$f(\mathbf{x}) = rac{1}{2} \|\mathbf{A}\mathbf{x} - \mathbf{y}\|_2^2, \quad \Psi(\mathbf{x}) = \lambda_1 \|\mathbf{x}\|_1 + rac{\lambda_2}{2} \|\mathbf{x}\|_2^2,$$

where  $\mathbf{A} \stackrel{\text{def}}{=} \mathbf{H}\mathbf{P}$ .

- A is ill conditioned
- Ψ is not differentiable
- Lipschitz constant of  $\nabla f(\mathbf{x})$  may be intractable to compute.

# Optimization algorithm

The Accelerated Composite Gradient Method (ACGM)

- Applicable to all composite problems
- State-of-the-art convergence rate
  - For non-strongly convex objectives
    - Same asymptotic rate as FISTA of  $O(1/k^2)$
    - Provably better constant
  - For strongly-convex objectives
    - Linear rate  $O((1-\sqrt{q})^k)$
- Estimation of  $\nabla f(\mathbf{x})$  Lipschitz constant
  - Automatic and dynamic at every iteration
  - · Lipschitz constant does not have to exist globally

• Twice as fast for objectives of type  $\tilde{f}(\mathbf{A}\mathbf{x}) + \Psi(\mathbf{x})$ 

# ACGM (unoptimized)

$$\begin{split} & | \text{nput:} \mathbf{x}_{0}, \lambda_{1}, \lambda_{2}, k_{max} \\ \mathbf{x}^{(-1)} &= \mathbf{x}^{(0)} \\ & \mathcal{L}^{(0)} &= || \mathbf{HP}_{\mathbf{x}}(0)|_{2}^{2}/||\mathbf{x}^{(0)}||_{2}^{2} \\ & q^{(0)} &= \frac{\lambda_{2}}{\mathcal{L}^{(0)} + \lambda_{2}} \\ & t^{(0)} &= 0 \\ & \text{for } k = 0, ..., k_{max} - 1 \text{ do} \\ & \alpha &:= 1 - q^{(k)}(t^{(k)})^{2} \\ & \mathcal{L}^{(k+1)} &:= r_{d}\mathcal{L}^{(k)} \\ & \text{loop} \\ & q^{(k+1)} &:= \frac{\lambda_{2}}{\mathcal{L}^{(k+1)} + \lambda_{2}} \\ & t^{(k+1)} &:= \frac{1}{2} \left( \alpha + \sqrt{\alpha^{2} + 4 \frac{\mathcal{L}^{(k+1)} + \lambda_{2}}{\mathcal{L}^{(k)} + \lambda_{2}}(t^{(k)})^{2}} \right) \\ & \beta &:= \frac{t^{(k)}}{t^{(k+1)}} \frac{1 - q^{(k+1)}t^{(k+1)}}{1 - q^{(k+1)}} \\ & \mathbf{z}^{(k+1)} &:= \mathbf{x}^{(k)} + \beta(\mathbf{x}^{(k)} - \mathbf{x}^{(k-1)}) \\ & \tau &:= 1/\mathcal{L}^{(k+1)} \\ & \mathbf{z}^{(k+1)} &:= \mathbf{x}^{(k)} + \beta(\mathbf{x}^{(k)} - \mathbf{x}^{(k-1)}) \\ & \tau &:= 1/\mathcal{L}^{(k+1)} \\ & \mathbf{G} &:= \mathbf{P}^{T} \mathbf{H}^{T} (\mathbf{HP}\mathbf{z}^{(k+1)} - \mathbf{y}) \\ & \mathbf{x}^{(k+1)} &:= \frac{1}{1 + \epsilon\lambda_{2}} \mathscr{F}_{\lambda_{1}}(\mathbf{z}^{(k+1)} - \tau \mathbf{G}) \\ & \text{ if } \|\mathbf{HP}\mathbf{x}^{(k+1)} - \mathbf{HP}\mathbf{z}^{(k+1)} \|_{2}^{2} \leq \mathcal{L}^{(k+1)} \|\mathbf{x}^{(k+1)} - \mathbf{z}^{(k+1)}\|_{2}^{2} \text{ then} \\ & \text{Break from loop} \\ & \text{else} \\ & \mathcal{L}^{(k+1)} &:= r_{u}\mathcal{L}^{(k+1)} \\ & \text{ end if } \\ & \text{ end loop} \\ & \text{end loop} \\ & \text{end for} \\ & \text{Output:} \mathbf{x}^{(k_{max})} \end{split}$$

#### Reducing computational intensity of ACGM

At every iteration k, ACGM computes

• auxiliary point  $\mathbf{z}^{(k+1)}$  by iterate extrapolation

$$\mathbf{z}^{(k+1)} = \mathbf{x}^{(k)} + \beta(\mathbf{x}^{(k)} - \mathbf{x}^{(k-1)})$$

• quatities  $Az^{(k+1)}$  and  $Ax^{(k+1)}$  in  $\nabla f(z^{(k+1)})$  and line-search

Linearity of gradient and extrapolation presents opportunity

cache all values

$$\mathbf{\tilde{x}}^{(i)} = \mathbf{Ax}^{(i)}, \ i \in \{0, ..., k\}$$

obtain without applying A the auxiliary point

$$\mathbf{\tilde{z}}^{(k+1)} \stackrel{\text{def}}{=} \mathbf{A}\mathbf{z}^{(k+1)} = \mathbf{\tilde{x}}^{(k)} + \beta(\mathbf{\tilde{x}}^{(k)} - \mathbf{\tilde{x}}^{(k-1)})$$

# ACGM (optimized)

Input:  $\mathbf{x}_0$ ,  $\lambda_1$ ,  $\lambda_2$ ,  $k_{max}$ 
$$\begin{split} & \tilde{\textbf{x}}^{(0)} := \textbf{HPx}^{(0)}, \\ & \textbf{x}^{(-1)} = \textbf{x}^{(0)}, \quad \tilde{\textbf{x}}^{(-1)} = \tilde{\textbf{x}}_0 \end{split}$$
 $L^{(0)} = \|\mathbf{\tilde{x}}^{(0)}\|_{2}^{2} / \|\mathbf{x}^{(0)}\|_{2}^{2}$  $q^{(0)} = \frac{\lambda_2}{\mu(0)+\lambda_1}$  $t^{(0)} = 0$ for  $k = 0, ..., k_{max} - 1$  do  $\alpha := 1 - q^{(k)} (t^{(k)})^2$  $L^{(k+1)} := r_d L^{(k)}$ loop  $q^{(k+1)} := \frac{\lambda_2}{I(k+1) + \lambda_2}$  $t^{(k+1)} := \frac{1}{2} \left( \alpha + \sqrt{\alpha^2 + 4 \frac{L^{(k+1)} + \lambda_2}{L^{(k)} + \lambda_2}} (t^{(k)})^2 \right)$  $\beta := \frac{t^{(k)} - 1}{t^{(k+1)}} \frac{1 - q^{(k+1)} t^{(k+1)}}{1 - q^{(k+1)}}$  $\mathbf{z}^{(k+1)} := \mathbf{x}^{(k)} + \beta(\mathbf{x}^{(k)} - \mathbf{x}^{(k-1)}), \quad \tilde{\mathbf{z}}^{(k+1)} := \tilde{\mathbf{x}}^{(k)} + \beta(\tilde{\mathbf{x}}^{(k)} - \tilde{\mathbf{x}}^{(k-1)})$  $\tau := 1/L^{(k+1)}$  $\mathbf{G} := \mathbf{P}^T \mathbf{H}^T (\mathbf{\tilde{z}}^{(k+1)} - \mathbf{v})$  $\mathbf{x}^{(k+1)} := \frac{1}{1+\tau\lambda_2} \mathscr{T}_{\tau\lambda_1} (\mathbf{z}^{(k+1)} - \tau \mathbf{G}), \quad \tilde{\mathbf{x}}^{(k+1)} := \mathbf{HP} \mathbf{x}^{(k+1)}$ if  $\|\mathbf{\tilde{x}}^{(k+1)} - \mathbf{\tilde{z}}^{(k+1)}\|_2^2 \le L^{(k+1)} \|\mathbf{x}^{(k+1)} - \mathbf{z}^{(k+1)}\|_2^2$  then Break from loop else  $L^{(k+1)} := r_u L^{(k+1)}$ end if end loop end for Output:  $x^{(k_{max})}$ 

### Simulation: forward model

# Padding

- Allows us to reconstruct a TRF of the same size as the observed RF image
- Is an estimation of the surrounding tissues using information from the imaged TRF
- If this border information is not required, the reconstructed TRF can simply be cropped accordingly.
- Computationally efficient padding
  - Operator P is linear and separable along the dimensions of the image P = P<sub>m</sub>P<sub>n</sub>.
  - $\mathbf{P}_m$  pads every column of the image independently by applying the 1D padding (linear) operator  $\mathscr{P}(m_t, m_r)$ .
  - The row component  $\mathbf{P}_n$  treats every row as a column vector, applies  $\mathscr{P}(n_t, n_r)$  to it, and turns the result back into a row.

# Computationally efficient padding

Figure : Common matrix forms of 1D padding operators  $\mathscr{P}(10,3)$ . Black denotes a value of 1 and white denotes 0.

#### Theorem

Padding operator  ${\bf P}$  can be obtained programatically in the form of a sparse matrix as

$$\mathbf{P}=\mathscr{P}(n_t,n_r)\otimes\mathscr{P}(m_t,m_r).$$

# Notation: discrete convolution (analytical expression)

$$\mathbf{k} \in \mathbb{R}^{m_k imes n_k}, \quad m_a \geq m_k, n_a \geq n_k, \quad \mathbf{a} \in \mathbb{R}^{m_a imes n_a}$$
  
Valid convolution

$$(\mathbf{k} *_{1} \mathbf{a})_{i,j} \stackrel{\text{def}}{=} \sum_{p=1}^{m_{k}} \sum_{q=1}^{n_{k}} \mathbf{k}_{p,q} \mathbf{a}_{i-p+m_{k},j-q+n_{k}},$$
$$i \in \{1, ..., m_{a} - m_{k} + 1\}, \ j \in \{1, ..., n_{a} - n_{k} + 1\},$$

Full convolution

$$(\mathbf{k} *_{2} \mathbf{a})_{i,j} \stackrel{\text{def}}{=} \sum_{p=p_{i}}^{\bar{p}_{i}} \sum_{q=q_{j}}^{\bar{q}_{j}} \mathbf{k}_{p,q} \mathbf{a}_{i-p+1,j-q+1},$$
  

$$i \in \{1, ..., m_{a} + n_{k} - 1\}, \ j \in \{1, ..., n_{a} + n_{k} - 1\},$$
  

$$p_{i} = \max\{1, i - m_{a} + 1\}, \quad \bar{p}_{i} = \min\{i, m_{k}\},$$
  

$$q_{j} = \max\{1, j - n_{a} + 1\}, \quad \bar{q}_{j} = \min\{j, n_{k}\}.$$

### Notation: auxiliary operators (analytical expression)

Rotation operator

$$(\mathscr{R}(\mathbf{k}))_{i,j} \stackrel{\text{def}}{=} \mathbf{k}_{m_k-i+1,n_k-j+1},$$
  
 $i \in \{1,...,m_k\}, \quad j \in \{1,...,n_k\}.$ 

Exception index set

$$\mathscr{I}(a,b,c) \stackrel{\mathsf{def}}{=} \{1,...,c\} \setminus \{a,...,b\}, \quad 1 \leq a \leq b \leq c$$

Full-width window and zero padding operators

$$(\mathscr{W}_{s}(i_{1},i_{2})\mathbf{a})_{i,j} \stackrel{\text{def}}{=} \mathbf{a}_{i+i_{1},j}, \quad i \in \{0,...,i_{2}-i_{1}\}, \\ (\mathscr{Z}_{s}(i_{1},i_{2})\mathbf{a})_{i,j} \stackrel{\text{def}}{=} \begin{cases} \mathbf{a}_{i-i_{1},j}, & i \in \{i_{1},...,i_{2}\}, \\ 0, & i \in \mathscr{I}(i_{1},i_{2},m_{s}), \end{cases}$$

where  $j \in \{1, ..., n_s\}$  and index  $s \in \{t, p\}$  stands for image size quantities  $m_t$ ,  $m_p$ ,  $n_t$ , and  $n_p$ .
