## Abstract

This paper presents a method for stabilizing both cylindrical and spherical panorama videos with a 360-degree field of view. Our method decouples the rotation from other motions and applies different strategies for smoothing them. The proposed approach is 2.5D as it estimates 3D rotations without involving 3D structure-from-motion methods. It is more robust and can be performed in an incremental way.

## Introduction

A conventional method

The proposed method

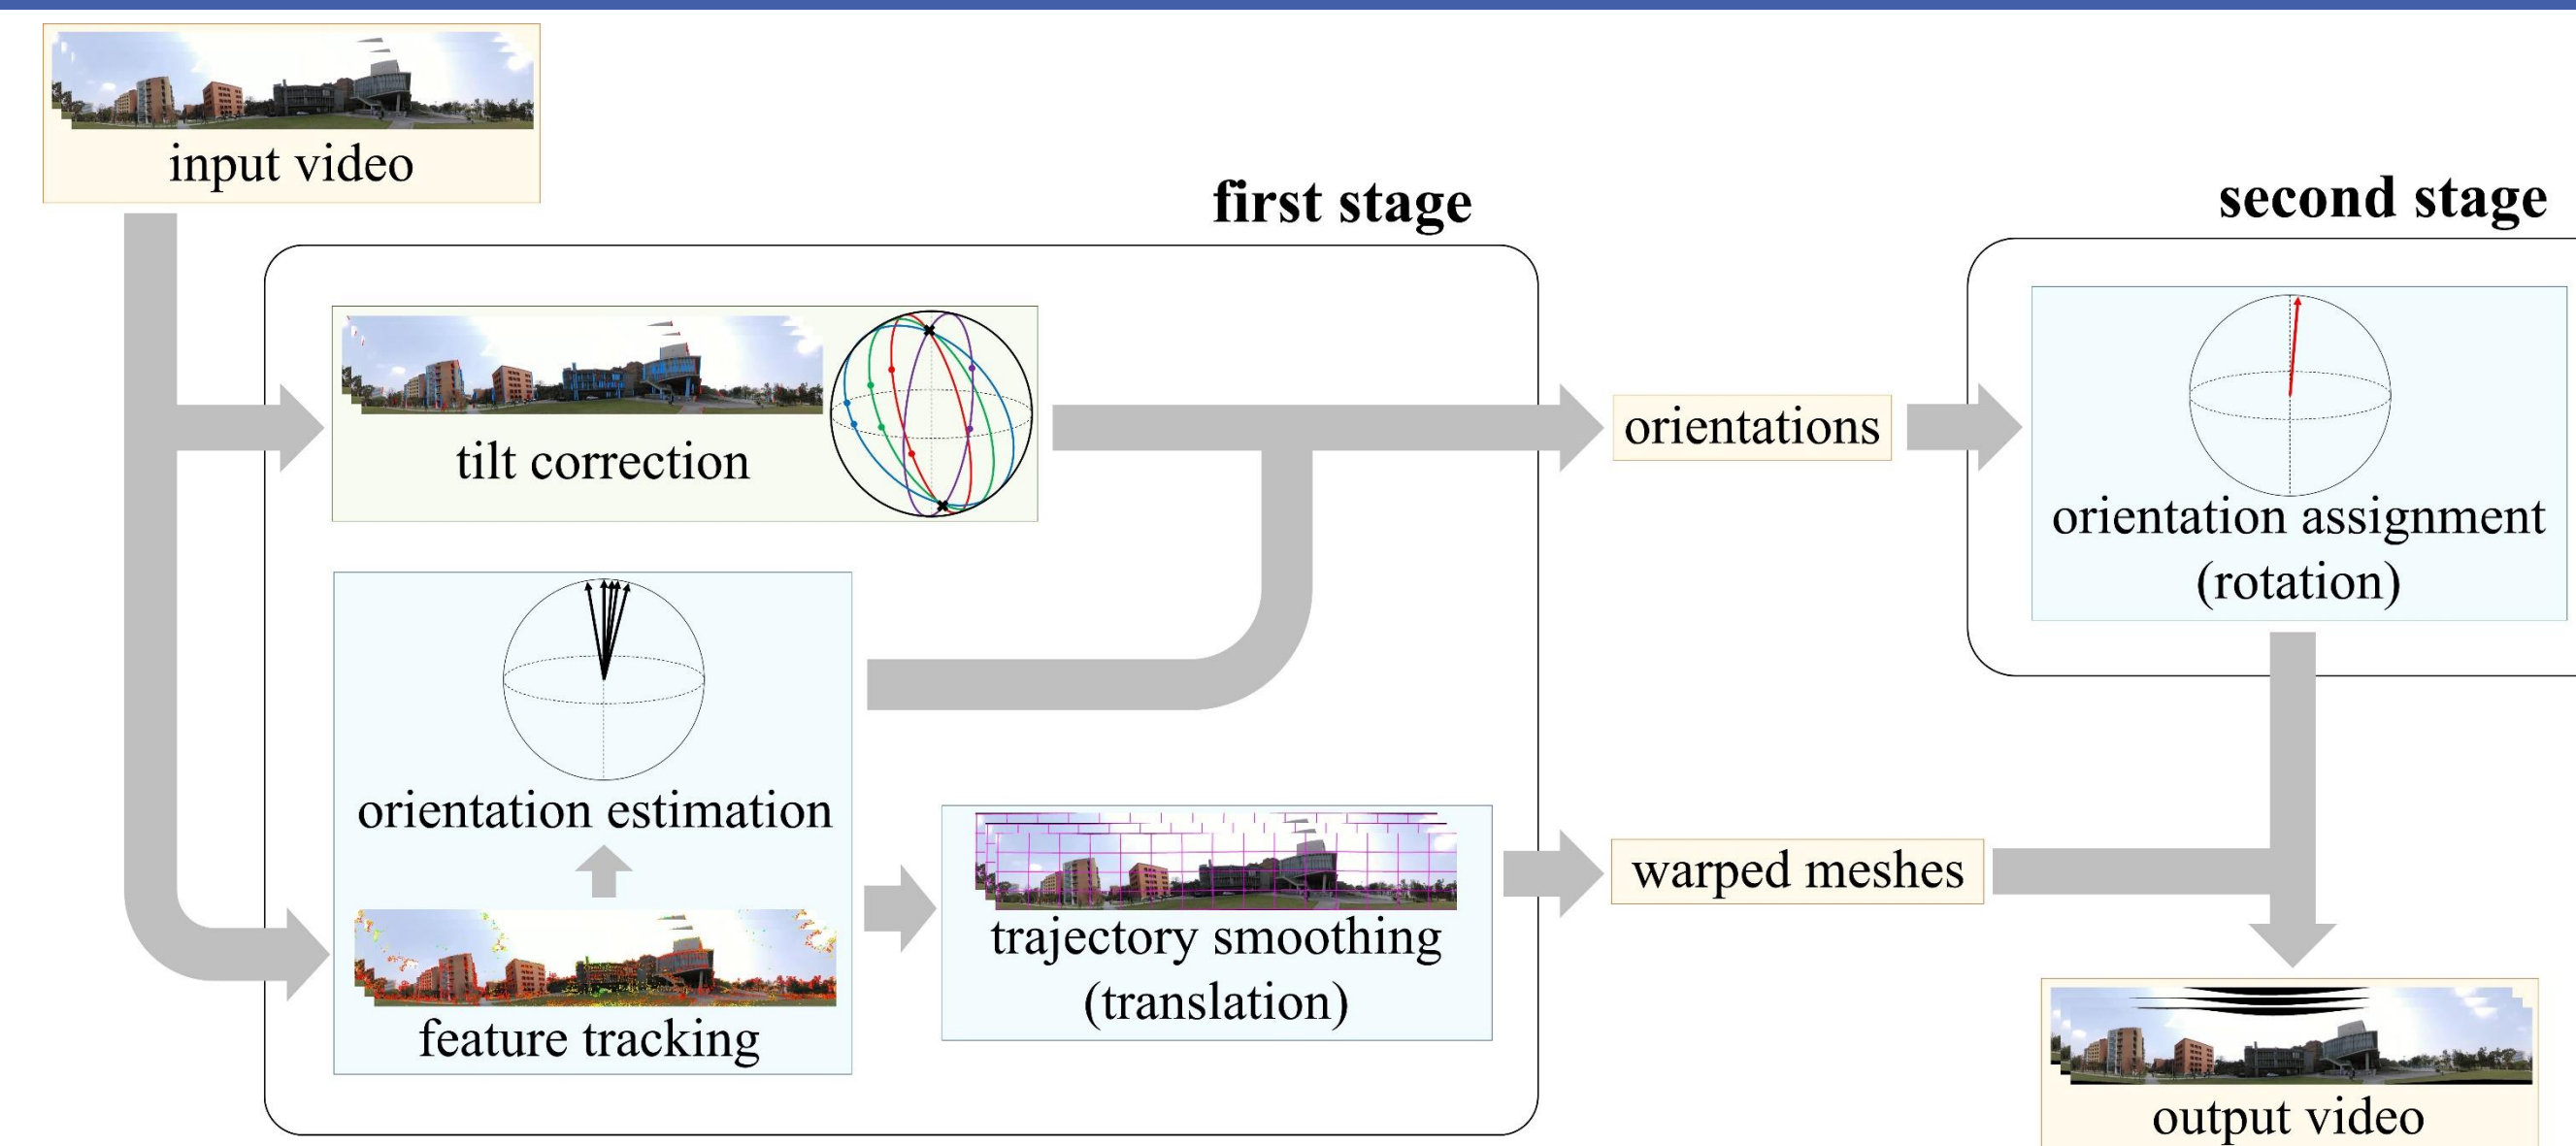

The proposed method with tilt correction

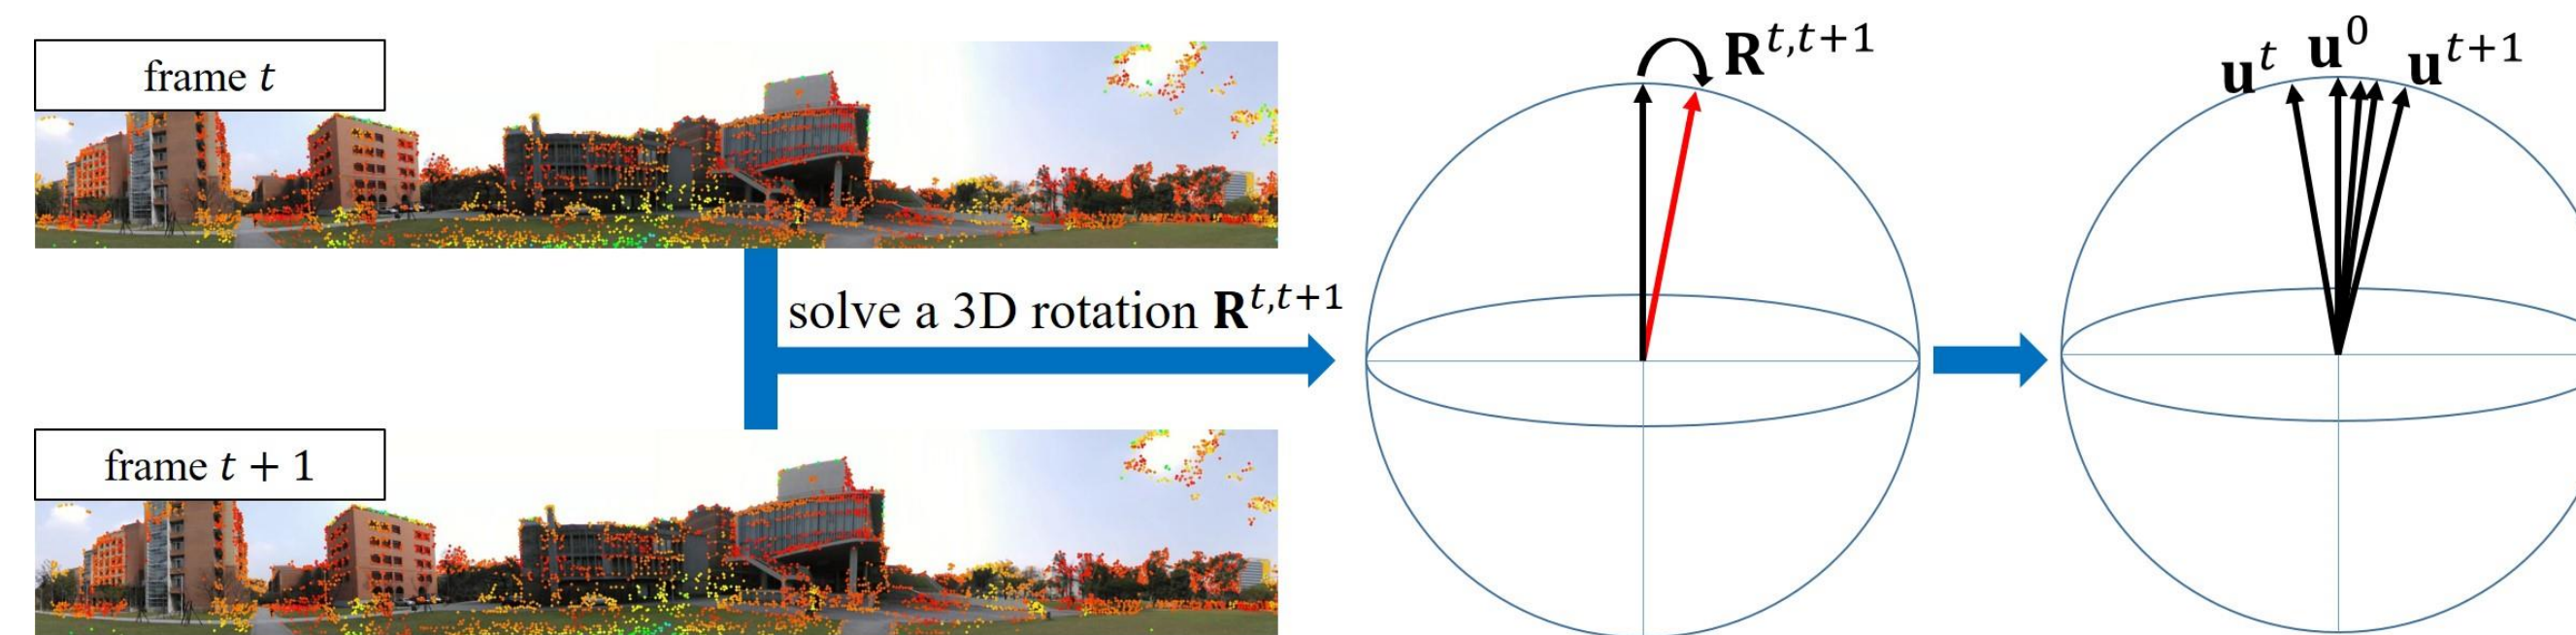

The influence of camera rotation

## Overview of the proposed method

## Orientation estimation

## Trajectory smoothing

$$E(\mathbf{V}) = E_d(\mathbf{V}) + \lambda E_s(\mathbf{V})$$

## Title correction

## Camera models

## Results

Bundle camera path

The proposed method

With tile correction

Results for cylindrical videos.

Original video

Our results

With tilt correction  
Results for spherical videos.
