Motivations

- Motivated by convolutional neural networks.
- One-layer sparse coding model does not work well on large dataset.
- Can sparse coding be efficiently extend to deep architecture?

イロト イポト イラト イラ

Introduce SparseNet

Deep Sparse Coding Networks (SparseNet)

- Clean and neat framework based on sparse coding.
- Less tweaking on network architecture.
- Competitive performance on image classification using small model.
- Better interpretation of deep networks.

不同 トイモトイモ

SparseNet on Image Classification

Overwhelmingly outperforms previous sparse coding-based model.

- CIFAR-10: 94.19% accuracy compared to 81.40%. ¹
- CIFAR-100: 80.07% accuracy compared to 60.80%.
- STL-10: 83.11% accuracy compared to 67.90%.
- MNIST: 0.36% error rate compared to 0.54%.
- 1. Second best sparse coding-based approach until 2017 under fair comparison.

4 D N 4 B N 4 B N 4 B N

SparseNet on Image Classification

Exhibits competitive performance compared to deep neural networks (DNN).

- CIFAR-10: 94.19% accuracy compared to 96.42%.²
- CIFAR-100: 80.07% accuracy compared to 82.69%.
- STL-10: 83.11% accuracy compared to 76.29%.
- MNIST: 0.36% error rate compared to 0.21%.
- 2. Best reported result of deep neural network until 2017 under fair comparison.

4 D N 4 B N 4 B N 4 B N

Easily reproducible

Coded based on third-party deep learning toolbox (MatConvNet).

- Code available on GitHub: https://github.com/XiaoxiaSun/supervised-deep-sparse-codingnetworks
- Easy integration with deep learning schemes.
 - Batch normalization
 - Shortcut connection
 - Dropout, Swapout and more...

4 D N 4 B N 4 B N 4 B N

Difference from previous approaches

Figure: We extend sparse coding to a 14-layer deep architecture.

- Dictionary is trained using end-to-end supervised learning based on error backpropagation.
- Nonlinear dimension reduction is employed to reduce the redundancy of sparse codes.
- Regularization parameters are adaptive to the given task.
- Render state-of-the-art performance.

Inference with nonnegative sparse coding

Enforce nonnegative constraint on sparse codes.

$$\boldsymbol{\alpha}^* = \arg\min_{\boldsymbol{\alpha}>\mathbf{0}} \frac{1}{2} \|\mathbf{x} - \mathbf{D}\boldsymbol{\alpha}\|_2^2 + \lambda_1 \|\boldsymbol{\alpha}\|_1 + \frac{\lambda_2}{2} \|\boldsymbol{\alpha}\|_2^2, \tag{1}$$

Advantages of nonnegative sparse coding.

- Fast convergence. Converges in 30-50 iterations in practice.
- Known clustering effect, similar to semi-nonnegative matrix factorization (semi-NMF).

Explosion of feature dimension

One-layer sparse coding cannot be naturally extended to multilayer architecture

- Employ wide dictionary each layer is computationally infeasible.
- Needs to reduce the dimensionality of sparse codes before passing to the deeper layer.

4 6 1 1 4

Bottleneck module

Reduce the dimensionality of sparse codes.

A D b 4 A b

Architecture of SparseNet

- The deep SparseNet is constructed by repeatedly stacking multiple bottleneck modules.
- Bottleneck module consists of one expansion layer and one reduction layer.
- Contains 14 sparse coding layers.

Supervised learning for SparseNet

Formulation with multilevel optimization:

$$\min_{\theta} \frac{1}{S} \sum_{s=1}^{S} L(y_{s}, f(\mathcal{A}_{s}^{(h)}, \mathbf{w})) + \frac{\mu}{2} R(\theta),$$
s.t. $\alpha_{s}^{(H)^{*}} = \arg\min_{\alpha_{s}^{(H)} \ge \mathbf{0}} F(\mathbf{D}^{(H)}, \lambda^{(H)}, \mathbf{x}^{(H)_{s}}, \alpha_{s}^{(H)}),$
:
s.t. $\alpha_{s}^{(1)^{*}} = \arg\min_{\alpha^{(1)} \ge \mathbf{0}} F(\mathbf{D}^{(1)}, \lambda^{(1)}, \mathbf{x}_{s}^{(1)}, \alpha_{s}^{(1)}),$
s.t. $\lambda^{(h)} > 0, \ \mathbf{x}_{s}^{(h)} = \psi(\alpha_{s}^{(h-1)^{*}}), \quad \forall h = 1, ..., H,$ (2)

where $\theta = \{ \mathbf{D}^{(h)}, \lambda^{(h)} \}_{h=1}^{H}$.

CIFAR-10 and CIFAR-100

- 50,000 training images, 10,000 testing images.
- Evenly split into 10 (CIFAR-10) or 100 (CIFAR-100) classes.

Classification on CIFAR-10 and CIFAR-100

Table: Classification Error (%) on CIFAR-10 and CIFAR-100.

Method	# Params	# Layers	CIFAR-10	CIFAR-100
SCKN [1]	10.50M	10	10.20	-
OMP [2]	0.70M	2	18.50	-
PCANet [3]	0.28B	3	21.33	-
NOMP [4]	1.09B	4	18.60	39.92
NiN [5]	-	-	8.81	35.68
DSN [6]	1.34M	7	7.97	36.54
WRN [7]	36.5M	28	4.00	19.25
ResNet-110 [8]	0.85M	110	6.41	27.22
ResNet-1001 v2 [9]	10.2M	1001	4.92	27.21
ResNext-29 [10]	68.10M	29	3.58	17.31
SwapOut-20 [11]	1.10M	20	5.68	25.86
SwapOut-32 [11]	7.43M	32	4.76	22.72
SCN-1	0.17M	15	8.86	25.08
SCN-2	0.35M	15	7.18	22.17
SCN-4	0.69M	15	5.81	19.93

3

< ロ > < 同 > < 回 > < 回 >

STL-10

- 5,000 labeled training images, 8,000 testing images.
- Evenly split into 10 classes.

Classification on STL-10

Table: Classification Accuracy (%) on STL-10.

Method	#Params	#Layers	Accuracy
SWWAE [12]	10.50M	10	74.33
Deep-TEN [13]	25.60M	50	76.29
SCN-4	0.69M	15	83.11

- Follow the supervised training protocol of [13].
- Training takes about 25 hours on a server with 4 Nvidia Tesla P40 GPUs.
- State-of-the-art performance with few labeled samples.

Classification on MNIST

Table: Classification Error (%) on MNIST.

Method	#Params	#Layers	Accuracy
CKN [14]		2	0.39
ScatNet [15]	-	3	0.43
PCANet [3]	-	3	0.62
S-SC [16]	-	1	0.84
TDDL [17]	-	1	0.54
SCN-4	0.69M	15	0.36

- Train with 25 epochs.
- Training takes about 4 hours on a server with 4 Nvidia Tesla P40 GPUs.
- Highest accuracy among sparse coding-based models.

Future works - Simplify backpropagation rule

• Dictionary update require matrix inversion:

$$\frac{\partial L}{\partial d_{jk}} = \left(\frac{\partial L}{\partial \alpha}\right)_{\Lambda}^{\top} \cdot (\mathbf{D}_{\Lambda}^{\top} \mathbf{D}_{\Lambda} + \lambda_{2} \mathbf{I}_{|\Lambda|})^{-1} \left(\frac{\partial \mathbf{D}_{\Lambda}^{\top} \mathbf{x}}{\partial d_{jk}} - \frac{\partial \mathbf{D}_{\Lambda}^{\top} \mathbf{D}_{\Lambda}}{\partial d_{jk}} \alpha_{\Lambda}\right). \quad (3)$$

- Around 80% computation time are spent for matrix inversion.
- Find possible ways to avoid it.

Conclusion

- Dictionary learning can efficiently adapt features to the given dataset.
- Extending sparse coding to multilayer architecture is able to substantially improve the performance.
- Computational complexity is much higher than deep neural network during backpropagation.
- Large potentials of improving performance of SparseNet.
