

# *COUNTERFEIT DETECTION*

## *USING PAPER PUF AND MOBILE CAMERAS*

Chau-Wai Wong\* *and* Min Wu  
UNIVERSITY OF MARYLAND, COLLEGE PARK, USA

November 17, 2015

# Introduction and Motivation

- ❑ Anti-counterfeiting mechanism: techniques to safeguard consumer goods, documents, and money.
- ❑ Existing anti-counterfeiting mechanisms

hologram [1]

UV ink [2]

random fibers

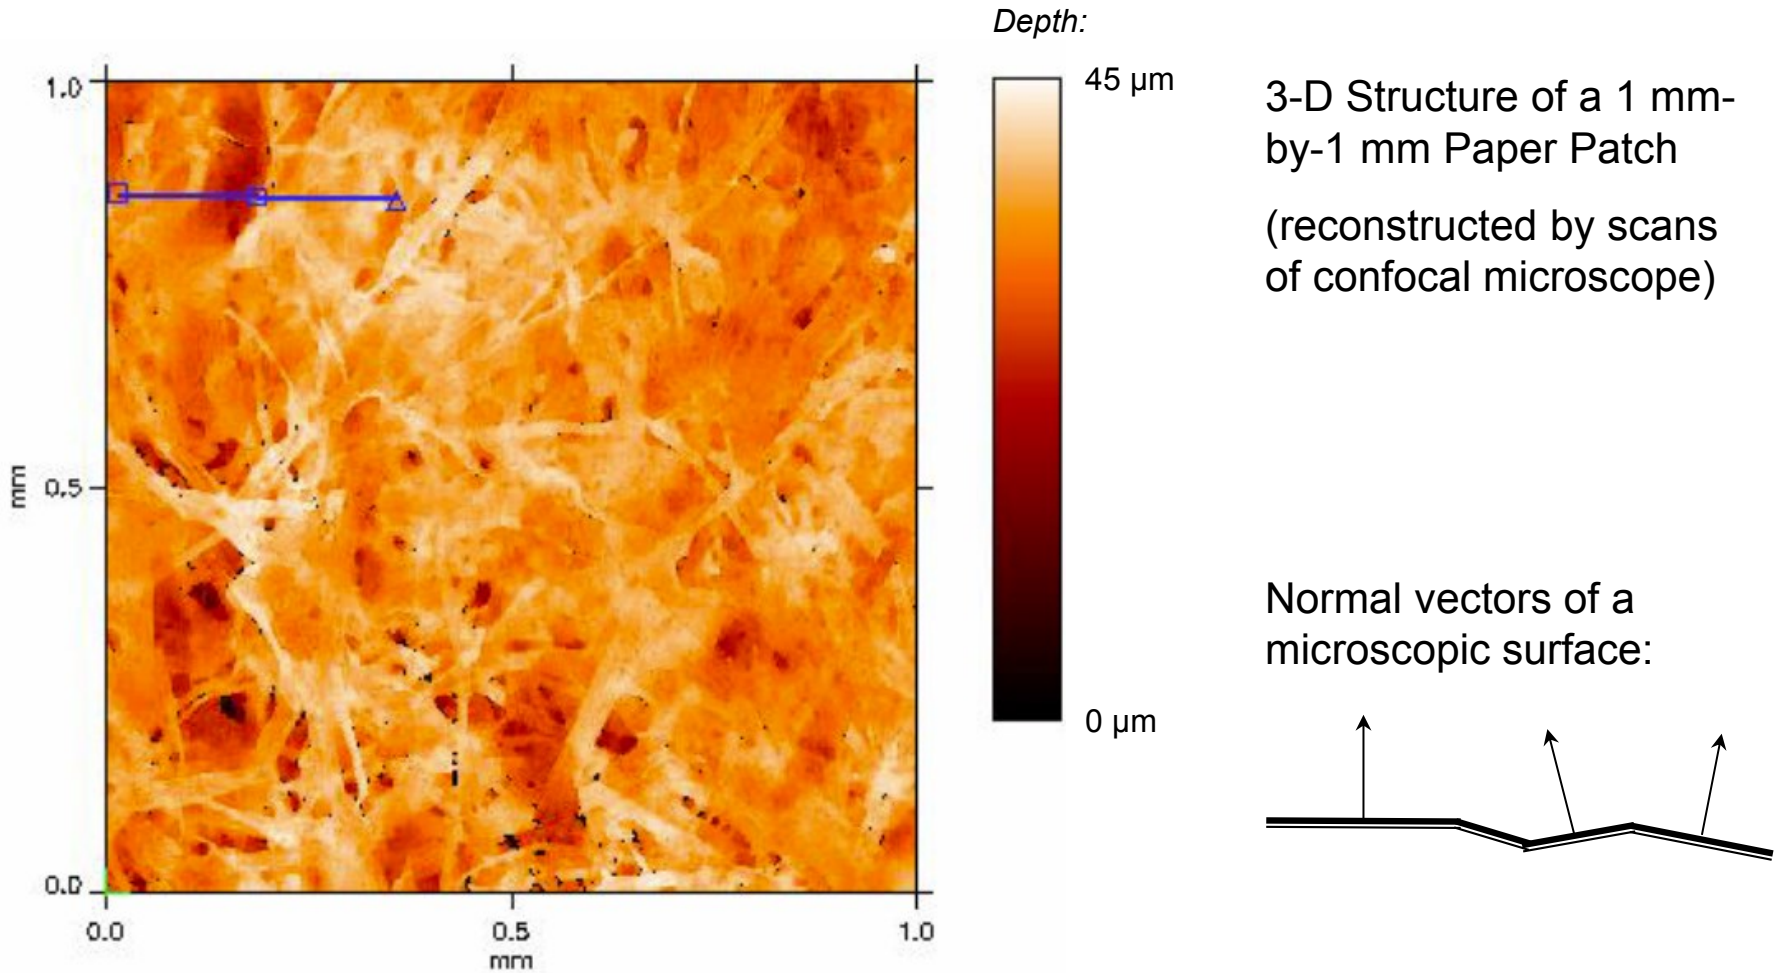

- *Expensive*
- *No ground truth*
- *Authenticity rely on manual decision*

- ❑ Investigate optical features of paper surfaces for anti-counterfeiting:
  - ❖ Precision: physical unclonable features (**PUFs**)
  - ❖ Automate verification & ease of use: **mobile imaging**
  - ❖ Relatively low-cost

# Physical Features of Paper: Unique 3-D Surfaces

Topography map of copy paper, reproduced from “High resolution surface topography FRT MicroProf chromatic aberration sensor,” in a product sheet by Innventia, Aug. 2012.

# High-End Camera Captured Patch (1 mm<sup>2</sup>)

RGB Combined

Red

Green

Blue

**Camera:** Canon EOS REBEL T2i; EF100mm f/2.8L Macro IS USM. **Capturing Condition:** Exposure 0.3 sec, f/2.8, ISO 100, 300 ppi, patch placed at 2f. Camera mounted on a tripod. **Credit:** King Lam Hui. R, G, and B channels are contrast enhanced.

# Scanner and Mobile Camera Captured Patches

Image of scanner captured patch  
with registration pattern:

**Registration container** (600 pixels per inch):

- Square box: 400-by-400 pixels
- Line width: 5 pixels
- 4 circles at corners
- Alignment: Hough transform, perspective transform, and correlation refinement

Contrast enhanced patches:

Scanner

iPhone 6

Pantech Tablet

# Extracted Norm Map [1] From 4 Scans

appearance images from 4 scan directions

estimated norm map

patch size:  $\frac{2}{3}$  in-by- $\frac{2}{3}$  in, 600 ppi,  
scanned by Epson 2450

What about using **mobile cameras** for norm map estimation?

[1] W. Clarkson, T. Weyrich, A. Finkelstein, N. Heninger, J. Halderman, and E. Felten, "Fingerprinting blank paper using commodity scanners," in *Proc. IEEE Symposium on Security and Privacy*, Berkeley, CA, May 2009, pp. 301-314.

# Challenge to Estimate Norm Map of Paper

- Shape/structure from photometric stereo:

R. Basri, D. Jacobs, I. Kemelmacher, "Photometric stereo with general, unknown lighting," *Int'l J. Computer Vision*, May 2007.

- In our problem, structure exists at a much smaller scale:

# Norm Maps: Scales & Scanner Models

scanner 2450

scanner GT2500

norm map, scale = 1.00

norm map, scale = 1.00

norm map, scale = 0.50

norm map, scale = 0.50

# Performance of Norm Maps

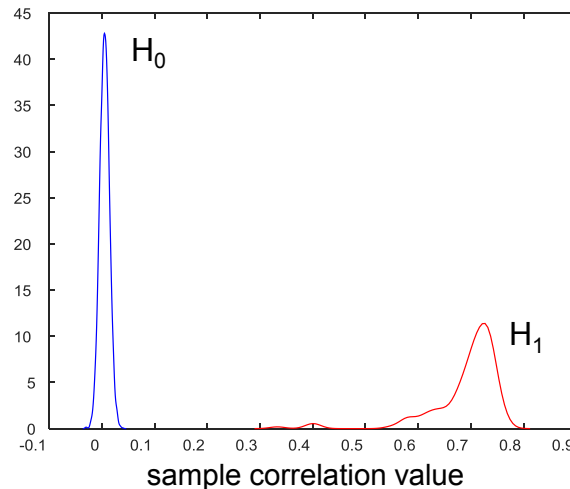

Very good performance!

PDFs for correlation:

- $H_0$ : test and ref images are from **different** patches
- $H_1$ : test and ref images are from the **same** patch

**Cross scanner exp.: Epson GT (test) vs. Epson 2450 (ref)**

Feature: length of norm vector

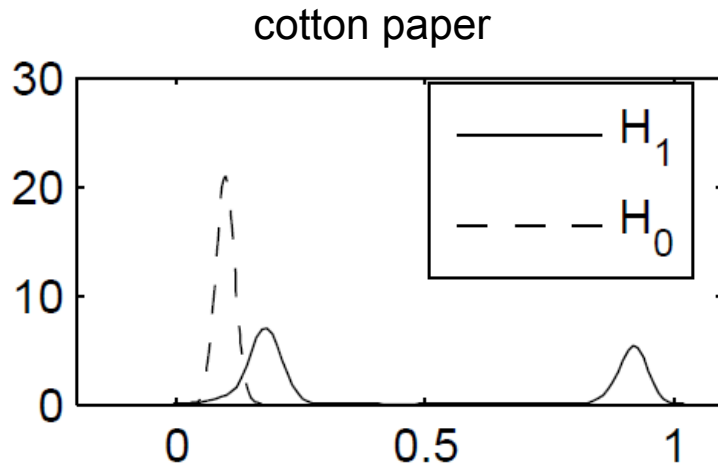

Feature: x-component of norm vector

What about directly using *scanned images* for authentication?

# Performance of Scanned Images

Won't work if scan dir. are not identical

scanned in  
opposite  
directions

Appearances  
differ in  
small details

Reason for **two peaks** of  $H_1$ : Although test and ref images are acquired from the same patch, there are 2 possible scanning directions.

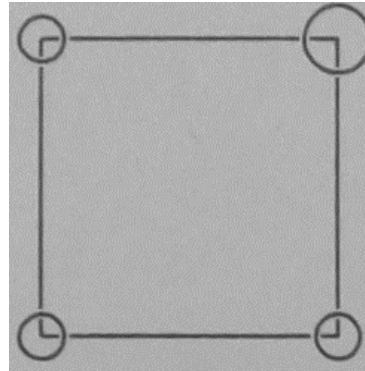

# Performance of Mobile Images

Limited performance!

iPhone 6

Pantech Tablet

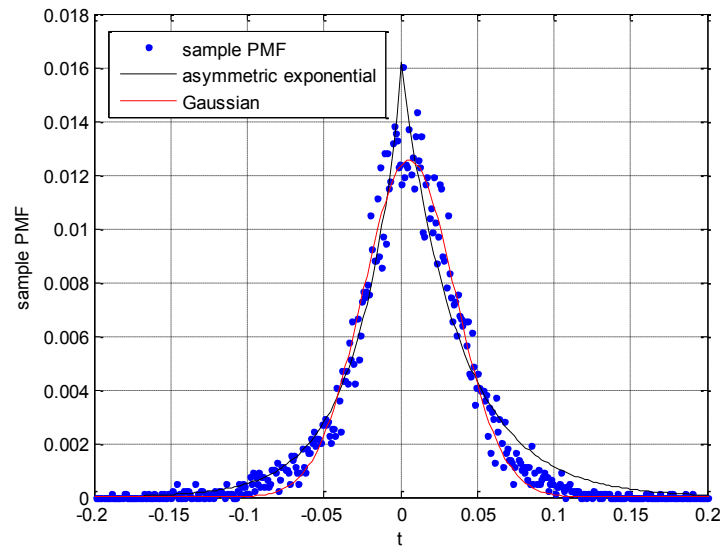

Captured images looks similar in high-level but details are quite different.

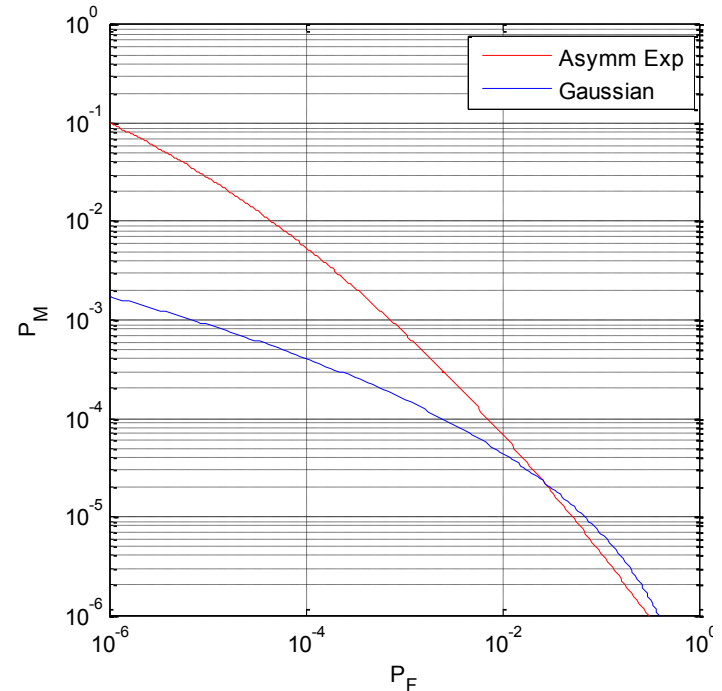

# Performance of Mobile Images

iPhone 6 (test)  
vs iPhone 6 (ref)

bounds for  $H_0$

bounds for ROC

# Performances of Different Schemes

<b>Device \ Feature</b>	<b>Intensity</b>	<b>Norm map</b>
<b>Scanner</b>		
<b>Mobile camera</b>		

# Exploiting Lighting: Mobile Images

Camera position  
and image index

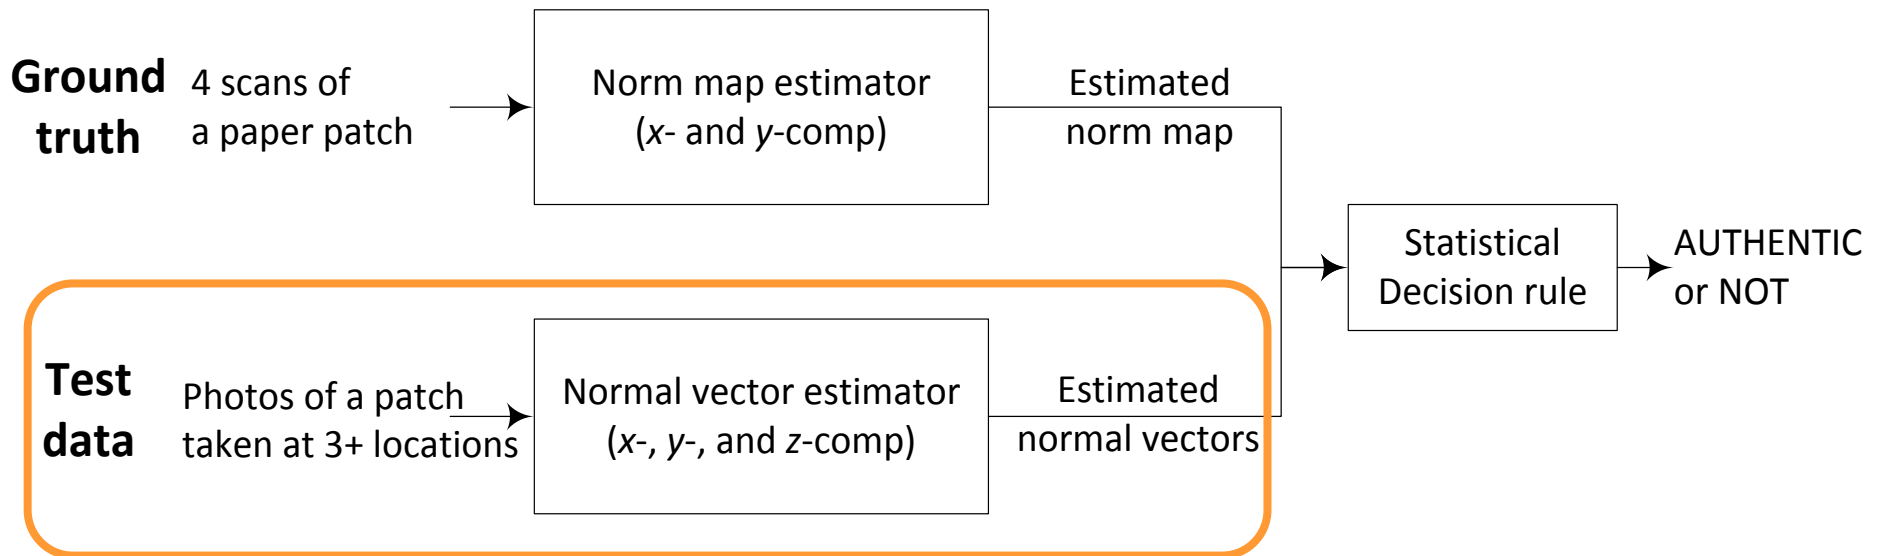

1	5	9	13	17
2	6	10	14	18
3	7	11	15	19
4	8	12	16	20

# Performances of Different Schemes

<b>Device \ Feature</b>	<b>Intensity</b>	<b>Norm map</b>
<b>Scanner</b>		
<b>Mobile camera (no flash)</b>		
<b>Mobile camera (with flash)</b>		

# Authentication Using Camera & Norm Map

# Reflection Model Used – Fully Diffuse

{ Diffuse  
Specular (mirror-like)

- ❑ Perceived intensity unaffected by eye/sensor position.
- ❑ Intensity depends only on angle  $\theta$  between  $\mathbf{n}$  and  $\mathbf{v}$

$$l_r(\mathbf{v}) = \underbrace{\lambda \cdot l}_{\propto \cos^\kappa \theta} \cdot \underbrace{\mathbf{n}^T \mathbf{v}}_{\cos \theta}$$

- ❖  $l$  is the strength of the light, and  $\kappa$  accounts for energy fall-off.
- ❖  $(\lambda \cdot l)$  as a whole can be compensated to obtain **normalized intensity**  $y$  with only the effect of  $\mathbf{n}^T \mathbf{v}$ , *i.e.*,

$$y \approx \mathbf{n}^T \mathbf{v}$$

# “Data” for Parameter Estimation

$$y \approx \mathbf{n}^T \mathbf{v}$$

□ Normalized intensity values  $y_1, \dots, y_M$ :

- ❖ Image #1 to # $M$
- ❖ Collocated positions

□ Incident directions  $\mathbf{v}_1, \dots, \mathbf{v}_M$ :

- ❖ Light of iPhone 6: one centimeter left to the camera
- ❖ Estimating camera position via geometric transform

# Estimated Norm Map Using iPhone 6

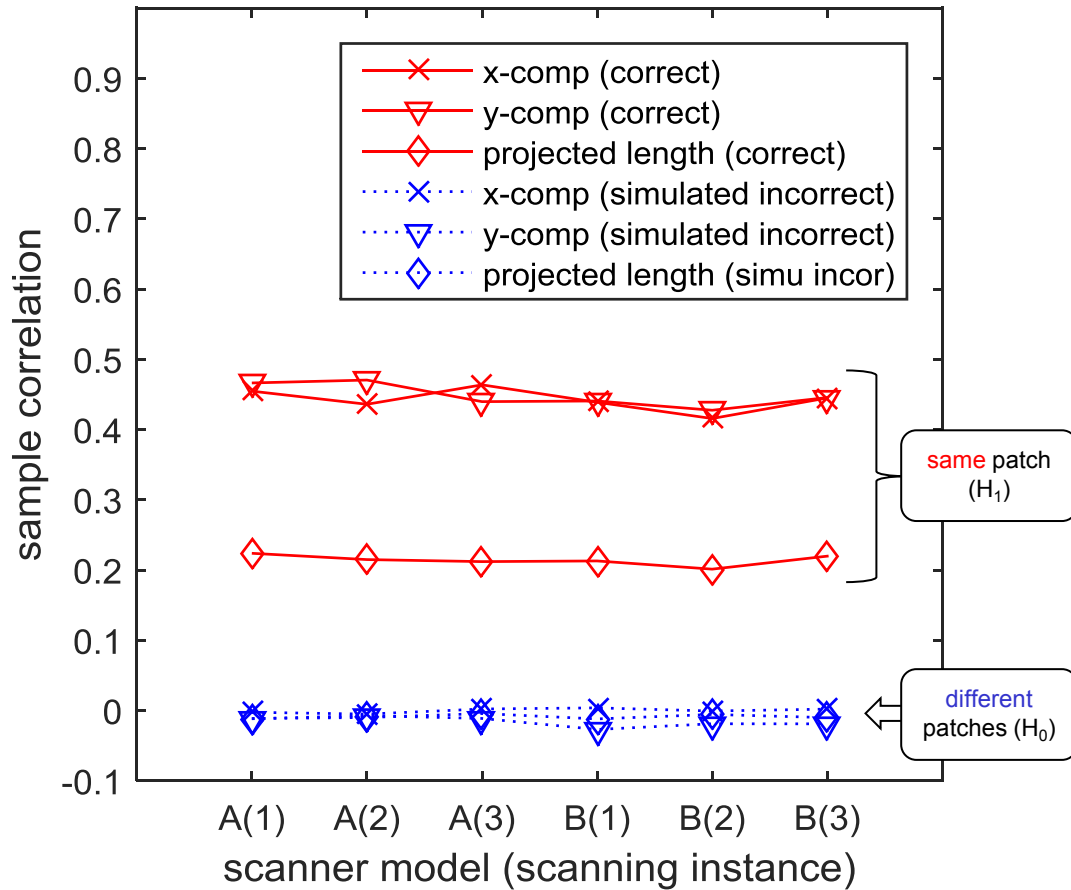

Estimated norm map consistent with results by high-precision ones by scanners.

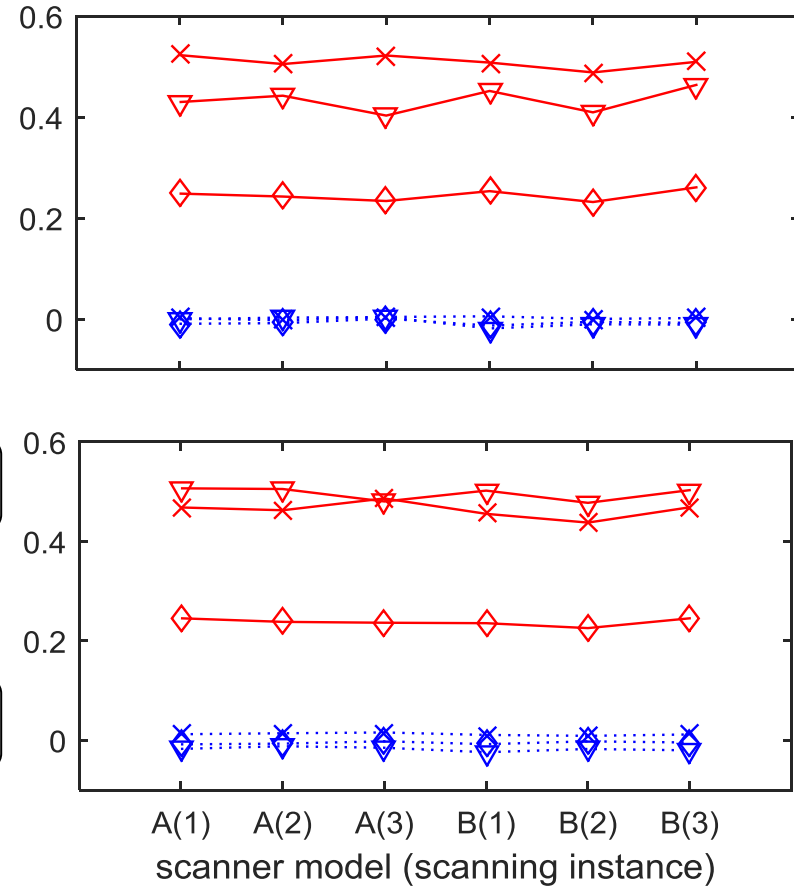

# Authentication Performances

Flashlight in a **dark** room

Flashlight with ambient light

# Conclusions

- ❑ Norm map: promising features to aid counterfeiting detection.
- ❑ First work towards using mobile camera to:
  - ❖ Successfully estimate the norm map
  - ❖ Enable authentication under a ubiquitous setting (ambient lighting)
- ❑ On-going & future work on practical issues:
  - ❖ Resiliency against physical tampering, *etc.*
  - ❖ General camera position setup
