Outline

A classifier for improving cause and effect in SSVEP-based BCIs

1

Introduction

- Cause and effect
- MusicBox
- EEG/SSVEP
- Feature extraction

3

Performance Metric

- Challenges
- Our performance metric

2

CCA_{cusum}

- Conventional approach
- Challenges
- Our approach
- Formulation
- Demo

4

Results

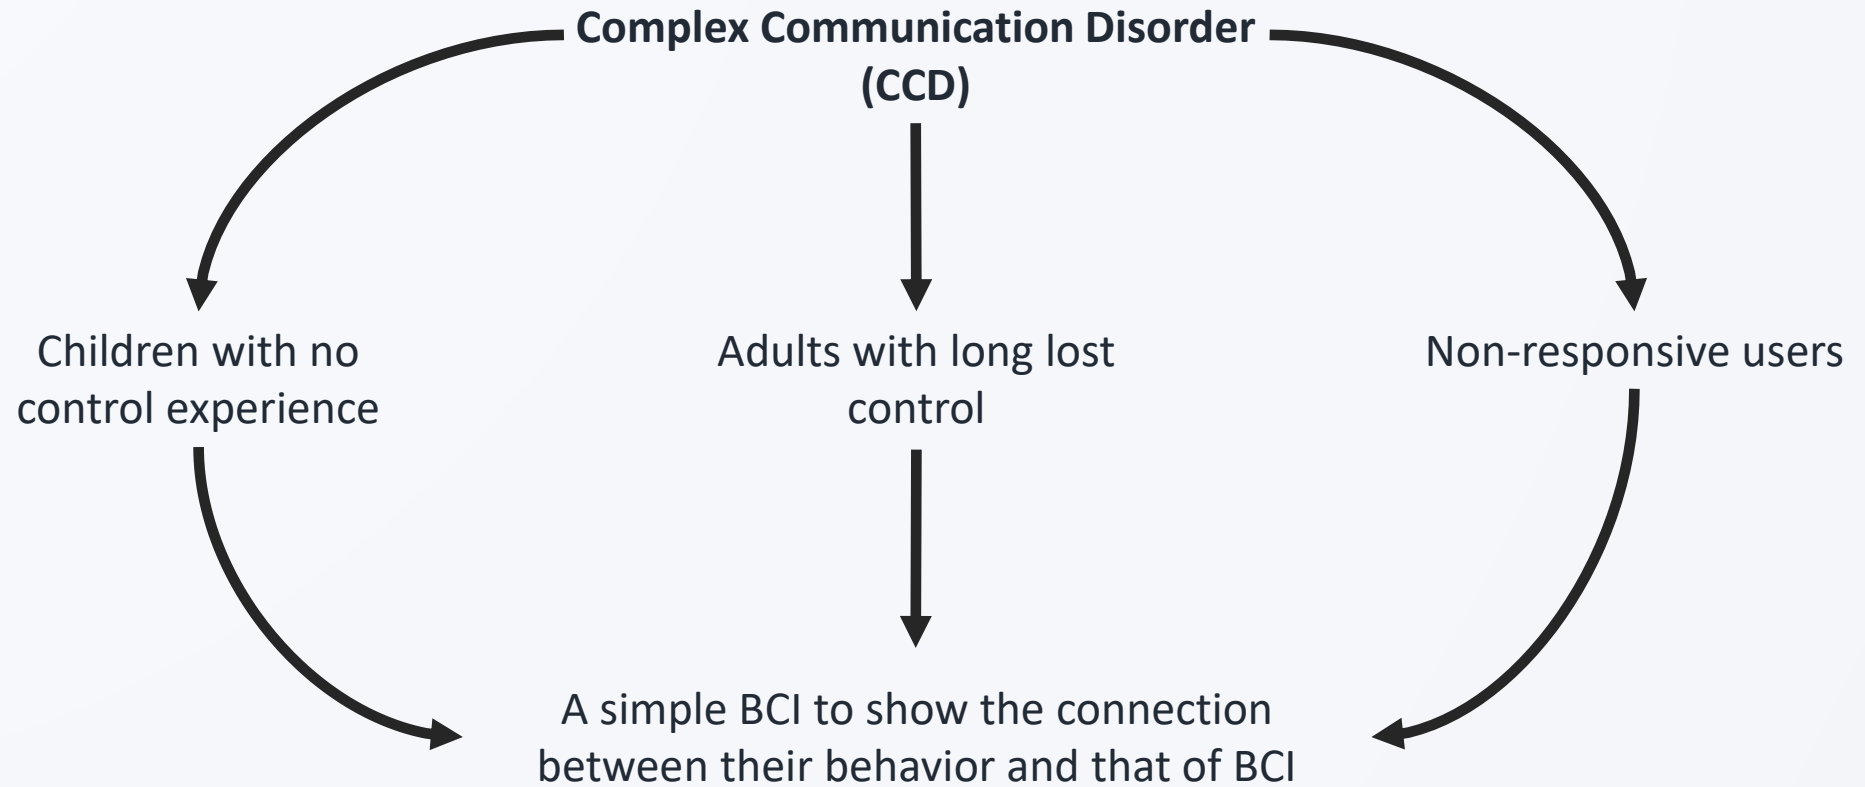

- Single case example
- Overall results
- Future work

Brain-Computer Interfaces (BCIs)

Our goal: Improving cause-and-effect relationship between BCIs and their users' behaviors

Cause and effect

MusicBox

Steady-state visual evoked potential (SSVEP)

Canonical correlation analysis (CCA)

Outline

A classifier for improving cause and effect in SSVEP-based BCIs

1 Introduction

- Cause and effect
- MusicBox
- EEG/SSVEP
- Feature extraction

3 Performance Metric

- Challenges
- Our performance metric

2 CCA_{cusum}

- Conventional approach
- Challenges
- Our approach
- Formulation
- Demo

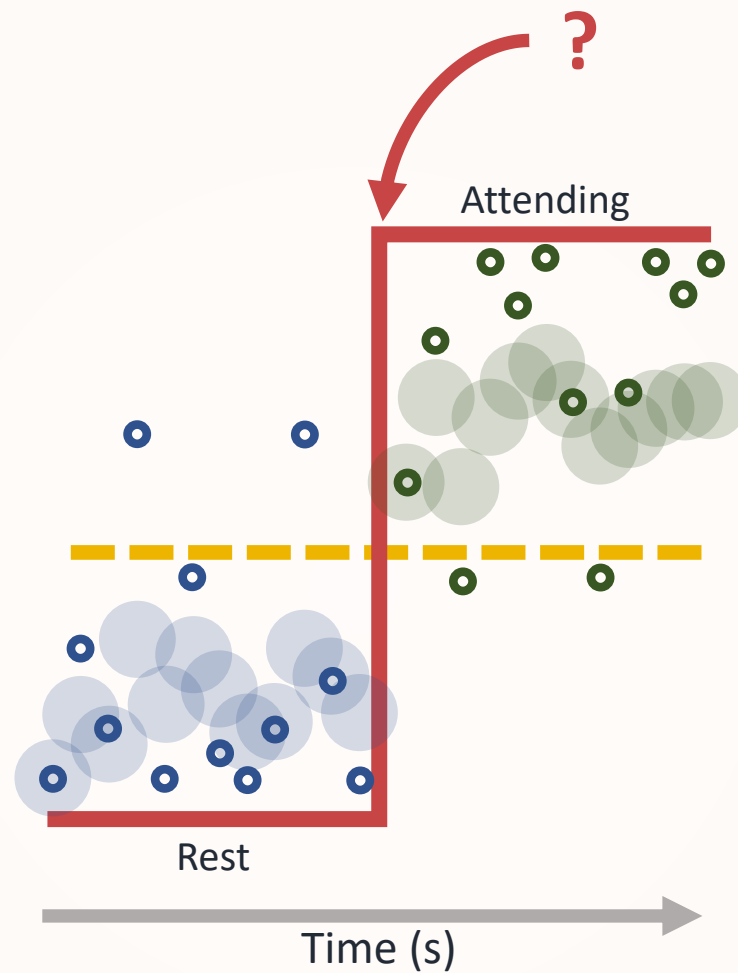

4 Results

- Single case example
- Overall results
- Future work

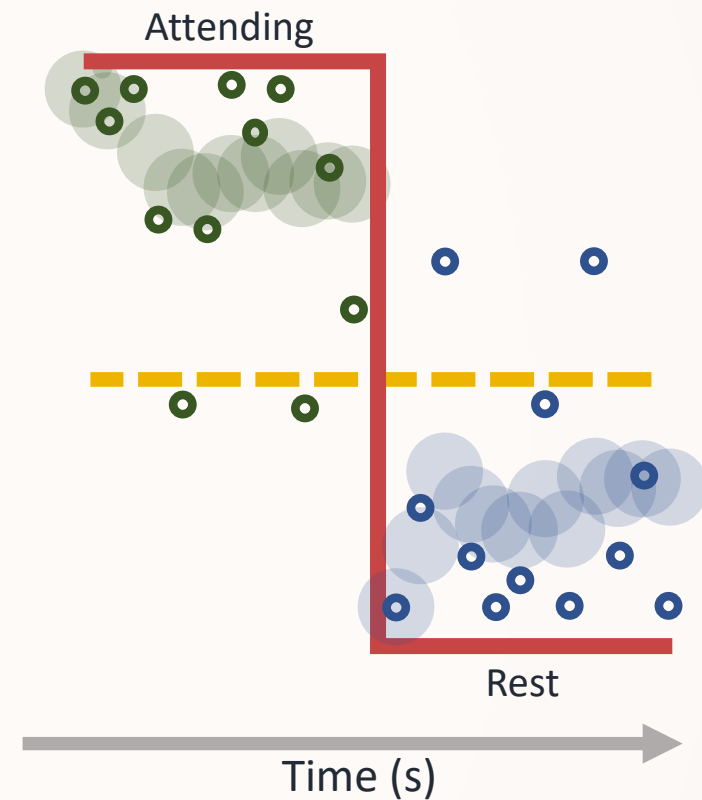

Classification

Positive
Change

H_0 : Data Distribution before change
 H_1 : Data Distribution after change

Negative
Change

CCA_{CUSUM}

$$\Lambda = \log \frac{p(r|H_0)}{p(r|H_1)} = \log p(r|\mathcal{M}, \theta_0) - \log p(r|\mathcal{M}, \theta_1)$$

Normal distribution

IID samples

$$\Lambda = \log p(r|\mu_0, \sigma) - \log p(r|\mu_1, \sigma)$$

Positive changes

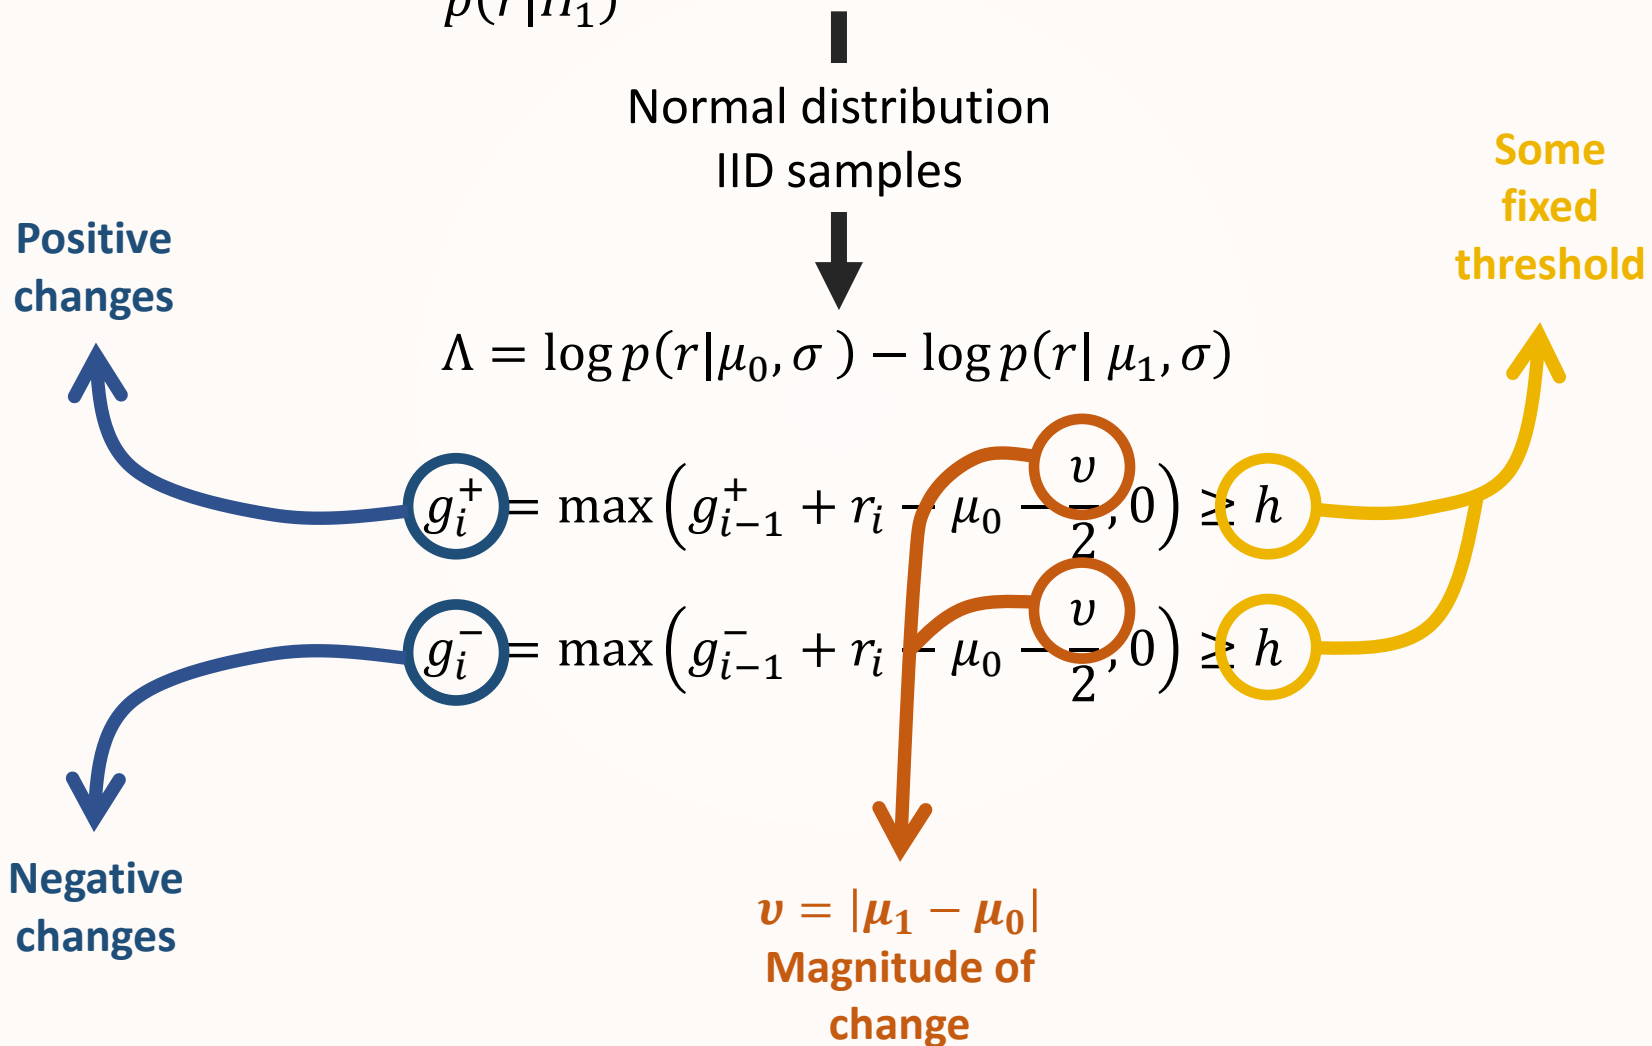

$$g_i^+ = \max \left(g_{i-1}^+ + r_i - \mu_0 - \frac{v}{2}, 0 \right) \geq h$$

$$g_i^- = \max \left(g_{i-1}^- + r_i - \mu_0 - \frac{v}{2}, 0 \right) \geq h$$

Negative changes

Some fixed threshold

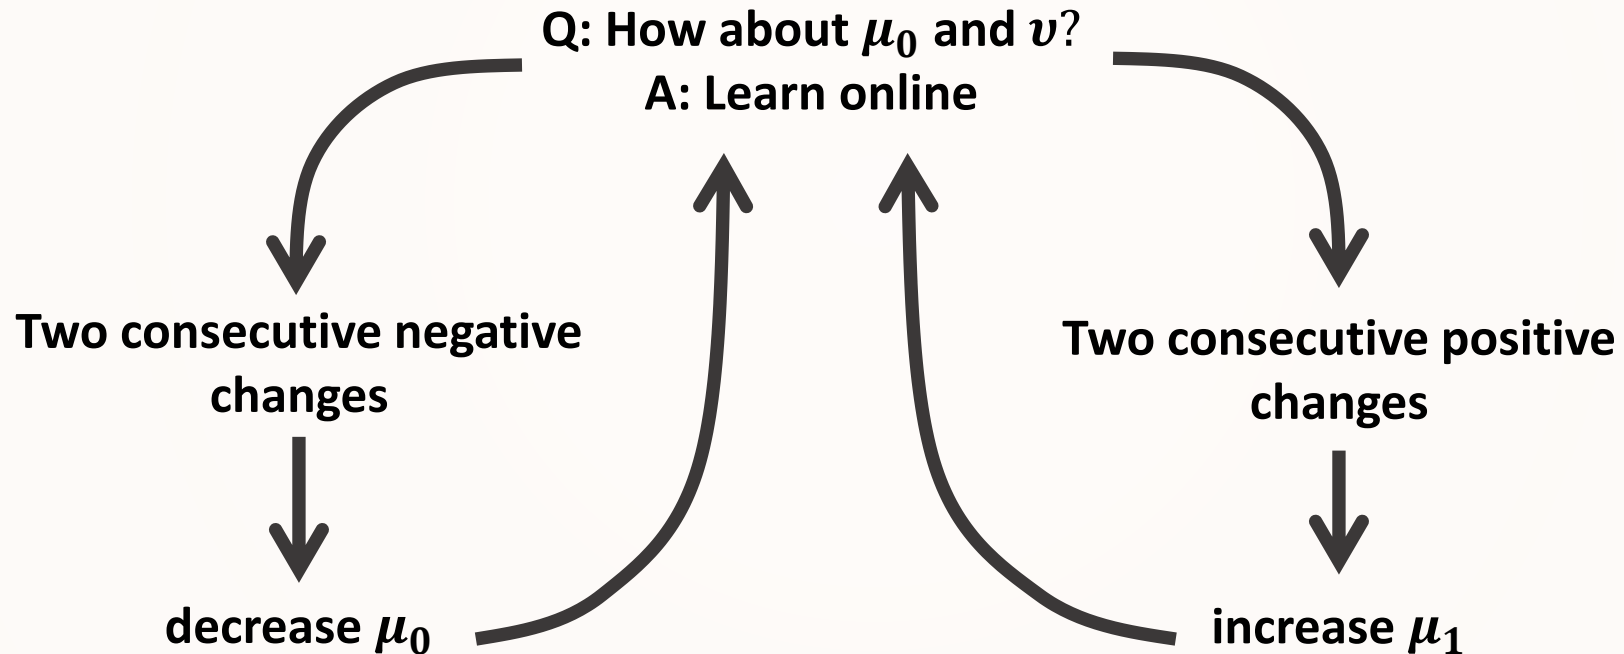

$v = |\mu_1 - \mu_0|$
Magnitude of change

Parameter Estimation

$$g_i^+ = \max\left(g_{i-1}^+ + r_i - \mu_0 - \frac{v}{2}, 0\right) \geq h$$

$$g_i^- = \max\left(g_{i-1}^- + r_i - \mu_0 - \frac{v}{2}, 0\right) \geq h$$

- Overall results
- Future work

Performance Metric

$$\text{EPO}_j = E \left[m \left| \begin{array}{l} r_k^j \text{ correctly classified as positive} \\ \forall k \in \{i + 1, \dots, i + m\} \end{array} \right. \right]$$

$$\text{ENO}_j = E \left[m \left| \begin{array}{l} r_k^j \text{ correctly classified as negative} \\ \forall k \in \{i + 1, \dots, i + m\} \end{array} \right. \right]$$

$$\text{EPOR}_j = \frac{\text{EPO}_j}{l_{\text{on}}}, \quad \text{ENOR}_j = \frac{\text{ENO}_j}{l_{\text{off}}}$$

$$M = \frac{2 \times \text{EPOR} \times \text{ENOR}}{\text{EPOR} + \text{ENOR}}$$

Performance Metric

EPOR = 1, ENOR = 0, M = 0

EPOR = 1, ENOR = 1, M = 1

EPOR = 1/2, ENOR = 1/2, M = 1/2

EPOR = 1/4, ENOR = 1/4, M = 1/4
