

HYBRID LSTM-FSMN NETWORKS FOR ACOUSTIC MODELING

Asa Oines, Eugene Weinstein, Pedro Moreno Google Inc., USA

Introduction

• Contextual information is key to training acoustic

models.

• Recursive neural networks (RNNs) such as Long

short term memory (LSTMs) are context-aware due

Hybrid LSTM/FSMN (FLMN)

• LSTM and FSMN layers are combined in one network.

| Output softmax | |
|----------------|--|
| t | |
| FSMN | |
| f | |
| FSMN | |
| 1 | |
| LSTM | |

Relaxing Real-time Requirements

- Our CTC models are ordinarily trained to output the
 - label at most 100ms after it was spoken (for real-time

ASR considerations).

• To match the context window sizes, we relaxed this to

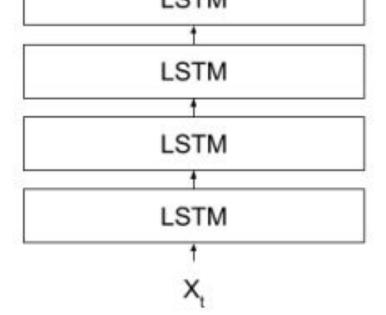

- to their recurrence mechanism, and usually outperform conventional neural networks.
- Connectionist temporal classification (CTC) allows
 neural networks to be trained to output the desired
 sequence of feature labels, but without the
 requirement to label specific feature vectors with
 specific labels (alignment).

FSMN

- Feedforward sequential memory networks (FSMN):
 Recently-proposed non-recurrent neural network
 topology which models past and future context through
 the use of memory blocks.
- Shown to be competitive with and even outperform
- LSTMs, and are faster to train ["Feedforward Sequential

Memory Networks: A New Structure to Learn Long-term

Dependency", S. Zhang, C. Liu, H. Jiang, S. Wei, L. Dai, Y.

Training Setup

- 80-dimensional log-mel features
- 25ms-window frames computed every 10ms
- Process every third frame (every 30ms)
- Mixed-bandwidth training (16kHz data, 20%
- downsampled to 8kHz, with features zero-padded)
- Artificially distort data with room simulation, added background noise (multistyle training MTR)
- Models trained with CTC criterion using asynchronous stochastic gradient descent (ASGD)
- FSMNs have 450ms of future+past context (15 frames)
 Data Sets
- Human-transcribed voice search and dictation training

550ms; however, quality does not improve.

• This suggests FLMN is better equipped to model

short-distance context.

| Language | LSTM VS WER (%) | | LSTM IME | LSTM IME WER (%) | | |
|----------|-----------------|---------|----------|------------------|--|--|
| | ≤ 550ms | ≤ 100ms | ≤ 550ms | ≤ 100ms | | |
| Swedish | 20.4 | 20.4 | 17.4 | 17.4 | | |
| English | 21.5 | 22.0 | 18.6 | 19.2 | | |

Varying FSMN Context Window

• We conducted experiments to evaluate the effect of

varying the context window size in FLMNs.

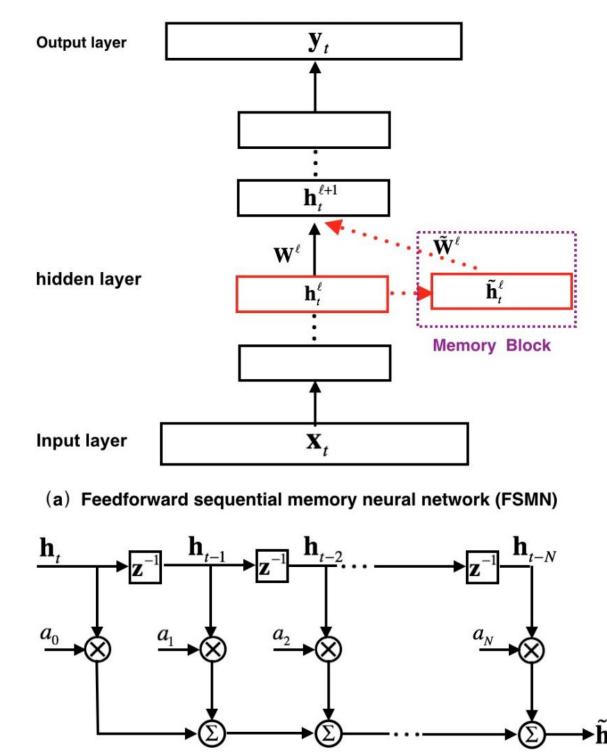

• Smaller context windows degrade in WER (French).

|----------------|-------|---------|---------|------|
| Activations | Time | | VS | IME |
| 15 | 450ms | 18.9 | 13.3 | 10.1 |
| 10 | 300mc | 18.6 | 1/1 | 10.2 |

Hu, TASLP, VOL. 25, NO. 4, April 2017].

• FSMN structure: Architecture diagram borrowed from

above paper (see also other FSMN paper in this session):

(b) Memory block in unidirectional FSMN as FIR filter

- Feedforward layers are combined with memory
 - blocks which encode the past N_1 and future N_2

activations of a feedforward layer.

$$\tilde{\mathbf{h}}_t^\ell = \sum_{i=0}^{N_1} a_i^\ell \odot \mathbf{h}_{t-i}^\ell + \sum_{j=1}^{N_2} c_j^\ell \odot \mathbf{h}_{t+j}^\ell$$

corpora:

| Language | Country | # utterances | # hours |
|----------|---------|--------------|---------|
| Swedish | Sweden | 3M | 3.5K |
| English | India | 11M | 14.6K |
| Italian | Italy | 10M | 13.6K |
| French | France | 16M | 24.2K |

- Test sets: human-transcribed test data
- VS (voice search); IME (dictation)
- Between 2K and 15K utterances (3-20 hours of audio)

Baseline Experiments

• Adding LSTM layers does not improve LER (Swedish):

| Layers | LER (%) |
|--------|---------|
| 5 | 27.5 |
| 6 | 27.6 |
| 7 | 27.5 |
| 8 | 27.3 |

• Baseline 5 layer LSTM LER (label error) and WER:

WER (%)

10300ms18.614.110.25150ms20.114.010.2

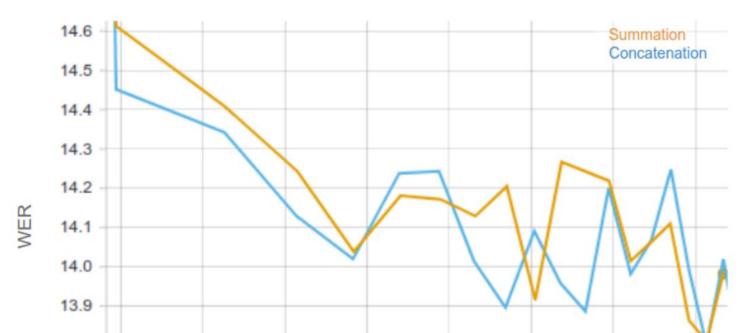

Reducing Model Size

- FSMN layer concatenates outputs of feedforward layer and memory block.
- This results in a doubling of the size of weight matrix of

following layer.

- We experimented with summing instead of
- concatenating to reduce model size.
- Experiments suggest that this does not affect

performance.

- $\mathbf{\tilde{h}}_{t}^{\ell}$: activations of the hidden feedforward layer at time t
- \mathbf{h}^{ℓ} : output of the memory block
- c^{ℓ} , a^{ℓ} : trainable encoding coefficients
- • : element-wise multiplication

Combining FSMN + LSTM

- In our early experiments, FSMN and LSTM
- performed comparably when trained with the CTC objective.
- Based on the hypothesis that their modeling power
 - can be complementary, we decided to experiment
 - with combining the two layer types in one network.

| Langua | age LER (%) | VS | IME |
|---------|-------------|------|------|
| Swedis | h 27.5 | 20.4 | 17.4 |
| English | 27.7 | 22.0 | 19.2 |
| Italian | 20.5 | 12.7 | 7.4 |
| French | 24.0 | 14.2 | 10.2 |

Hybrid FLMN Models

• 4 fully connected LSTM layers + 2 fully connected FSMN

layers (768 units per layer).

• Softmax with 8192 outputs (context-dependent phones).

| Language | VS WER (%) | | IME WER (%) | |
|----------|------------|------|-------------|------|
| | FLMN | LSTM | FLMN | LSTM |
| Swedish | 19.6 | 20.4 | 16.5 | 17.4 |
| English | 20.5 | 22.0 | 17.9 | 19.2 |
| Italian | 12.0 | 12.7 | 7.5 | 7.4 |
| French | 13.3 | 14.2 | 10.1 | 10.2 |

| | | | Training s | steps | | | |
|------|--------|--------|------------|--------|--------|--------|--------|
| | 80.00M | 90.00M | 100.0M | 110.0M | 120.0M | 130.0M | 140.0N |
| 13.7 | | | | | | | |
| 13.8 | | | | | | | |

Conclusions

• Combining FSMN and LSTM layers (FLMN) yields

greater contextual modeling power than LSTM alone, in

models that have similar numbers of parameters.

• This is likely due to the fact that FSMN focuses on

context surrounding the current frame, while LSTMs

are better at modeling longer-term context.
