IEEE ICIP 2017

Sept. 20, 2017

# Radon reconstruction

An image restoration task

- Radon transform
  - Line integrals -> sinogram
- Filtered back projection -> streaks
- Compressive sensing

Reference

Noisy reconstruction

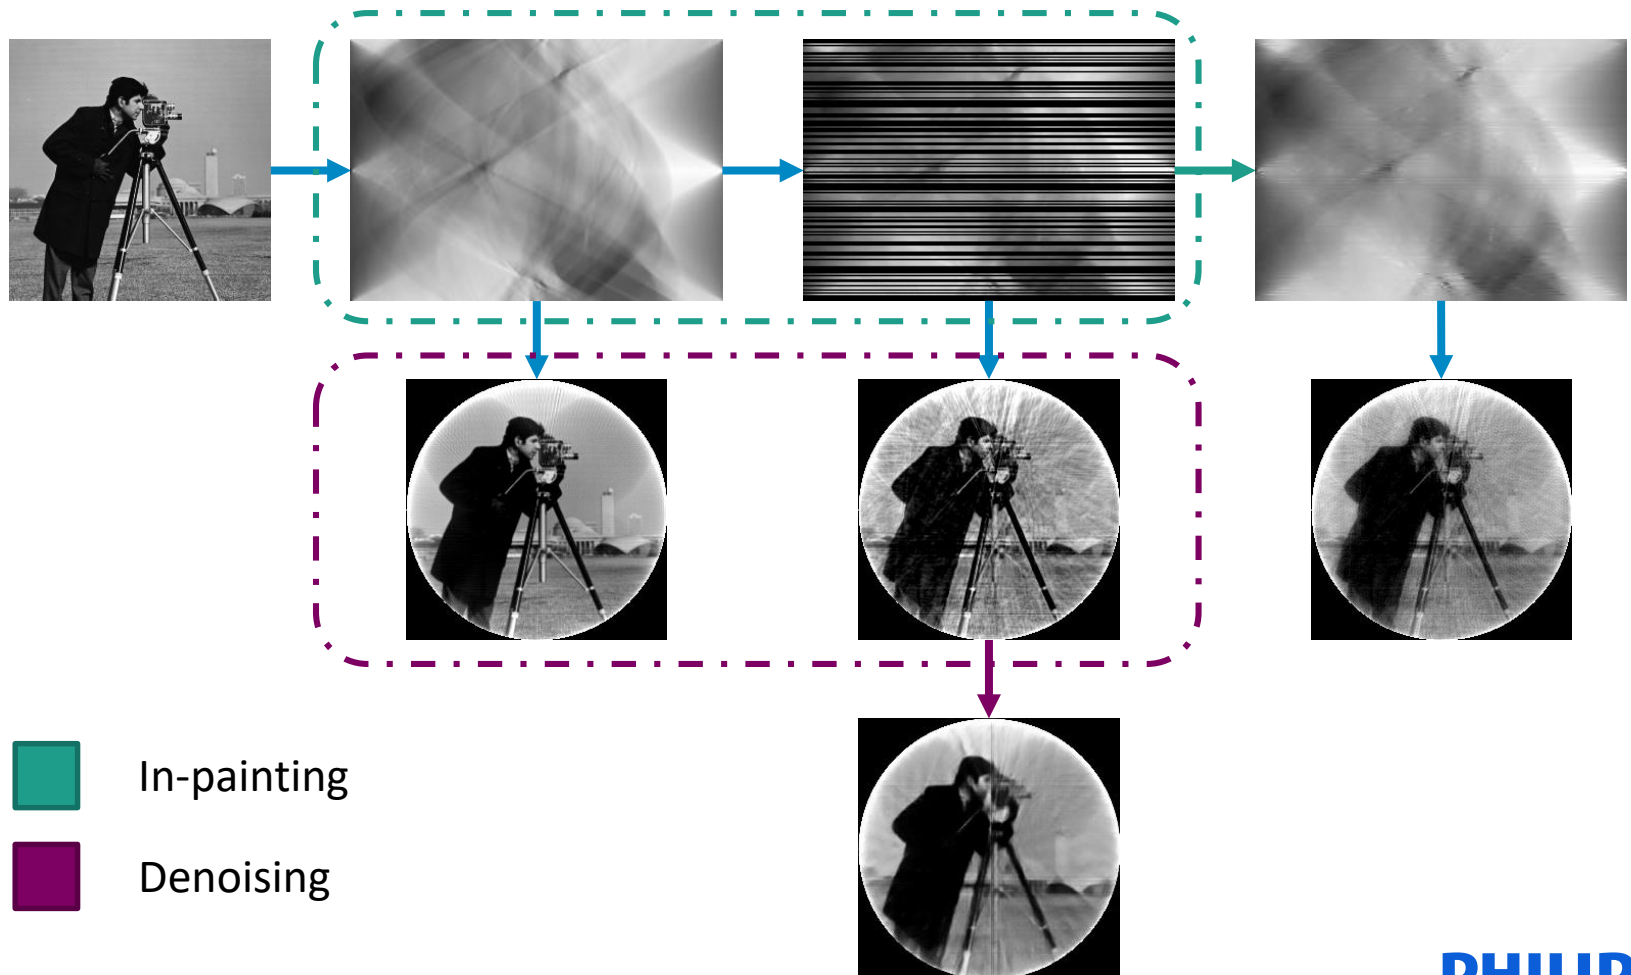

# Neural network

From machine learning to image restoration

# All possible approaches

In-painting and denoising (de-streaking)

# Neural network

What is that?

- **Plain neural network** (also called **Multi Layer Perceptrons**)
- Convolutional neural network
- Recurrent network

# Network training

## Dataset generation and reconstruction method

- ImageNet
  - Precomputed clean and noisy training pairs

# Network training

## Dataset generation and reconstruction method

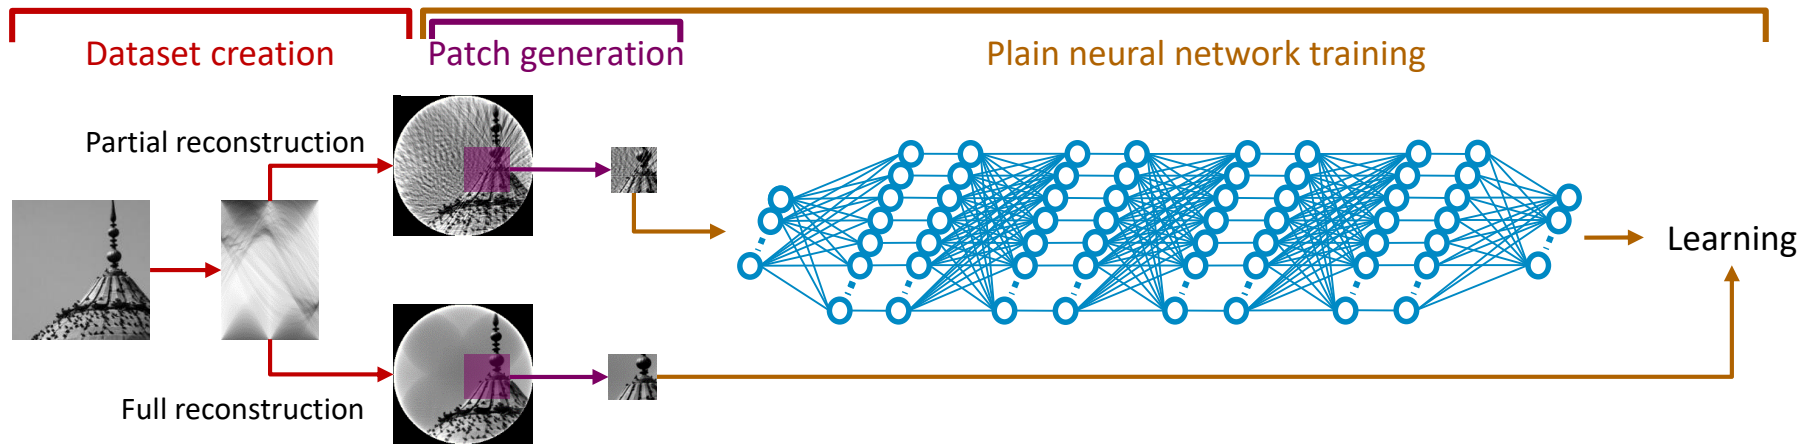

- Take a 17\*17 patch at a random position

# Network training

## Dataset generation and reconstruction method

- 4-layer neural network (Burger et al. 2012)
- 2047 neurons in the hidden layers, 249 neurons in the output layer

# Result

20% angles, phantom

# Results

20% angles, barbara

# Results

50% angles, barbara

# Results

## Feature maps

- Input features

- Output features

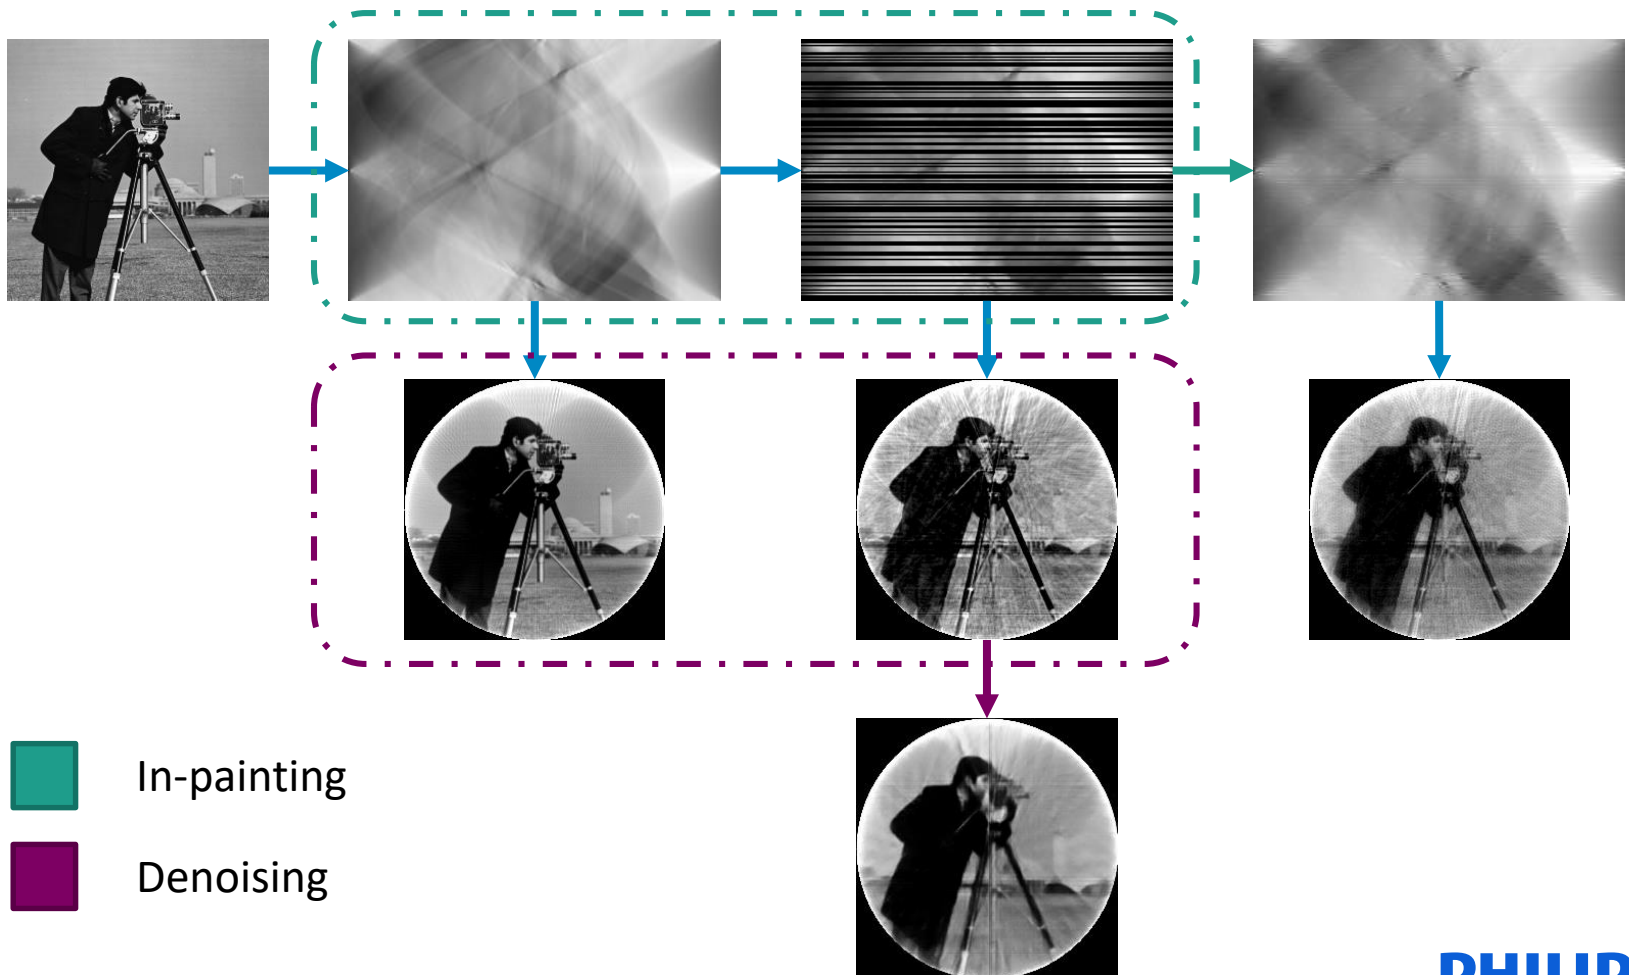

# Discussions

## De-streaking approach

- Advantages
  - Faster than iterative method
  - Works better when the number of missing angles is large
  - Only requires an input in the image domain
- Disadvantages
  - Information from sonogram are sometimes violated

# Discussions

## In-painting and denoising (de-streaking)

# Conclusion

## Future investigations

- What is the best neural network structure?
  - Convolutional layer on top of the whole image
- Is Mean Squared Error the best loss function?
- Would it be possible to combine in-painting and de-streaking approach?
