Augmented Lagrangian without alternating directions: practical algorithms for inverse problems in imaging Rahul Mourya, Loïc Denis, Eric Thiébaut, Jean-Marie Becker

Starting point

Many image processing tasks are formulated as a large scale optimization problem:

image restoration

► often requires to tune the regularization parameter

need fast and reliable optimization methods

don't want to also tune the optimization algorithm parameters avoid interplay between regularization & optimization parameter tuning

Results

▶ image deconvolution [Matakos, Ramani & Fessler 2013]

$$rgmin_{oldsymbol{x}>0} \|oldsymbol{H}oldsymbol{x}-oldsymbol{y}\|_{oldsymbol{W}}^2 + \lambda \mathrm{TV}(oldsymbol{x})$$

objective function after 1500 FFTs ADMM 3 splittings x = zADMM $\boldsymbol{\xi} = \boldsymbol{H} \boldsymbol{x} - \boldsymbol{y}$ 16splitting $v = \nabla x$ x = zproposed \checkmark almost insensitive to ρ optimization parameter ρ

[Matakos, Ramani & Fessler 2013] "Accelerated edge-preserving image restoration without boundary artifacts," IEEE Transactions on Image Processing [Houhou, Thiran & Bresson 2009] "Fast texture segmentation based on semi-local region descriptor and active contour," Numerical Mathematics: Theory, Methods and Applications [Goldstein, Bresson & Osher 2010] "Geometric applications of the split Bregman method: segmentation and surface reconstruction," Journal of Scientific Computing

Typical optimization problems in imaging

$$Lagrang f(\boldsymbol{x}) + r(\boldsymbol{z}) + \boldsymbol{u}$$

Hierarchical our proposition

$$\underset{\boldsymbol{x}}{\operatorname{arg min}} \quad f(\boldsymbol{x}) + \boldsymbol{u}^{\mathsf{t}}(\boldsymbol{x} - \boldsymbol{z}^{\star}) + \frac{\boldsymbol{r}}{2} \|\boldsymbol{x} - \boldsymbol{z}^{\star}\|_{2}^{2}$$
where $\boldsymbol{z}^{\star} \equiv \arg \min_{\boldsymbol{z}} r(\boldsymbol{z}) + \boldsymbol{u}^{\mathsf{t}}(\boldsymbol{x} - \boldsymbol{z}) + \frac{\rho}{2} \|\boldsymbol{x} - \boldsymbol{z}\|_{2}^{2}$
 $\boldsymbol{u} \leftarrow \boldsymbol{u} + \rho(\boldsymbol{x} - \boldsymbol{z})$

e.g., L1 norm to promote sparsity or indicator function for constraints
